Documentation of Code 2025

Run **Analysis 2025.do** for the analyses in the paper and figures. This command file can be run from a user-specified directory if the $doDirectory is set to "y", and otherwise runs from the current directory. In the former case the user specifies where LOG files and figures are to be saved. In the latter case it is either the corrent directory or an appropriate relative directory.

The analyses were run with *Stata* version 18, but should run with version 16.1. Several user-written programs were used, and can be installed by deleting the comment "*" from these lines at the top of the DO file:

```
* packages to install
*capture: ssc install vcemway
*capture: ssc install norm

* download this program to do a specific combined graph
*capture: net install grc1leg2, from("http://digital.cgdev.org/doc/stata/MO/Misc")
```

Output is to one LOG file, as well as a LOG file with selected results for tables and text.
