LDMS DATA FILES
USER'S GUIDE

Prepared by DBS Corporation under subcontract to
Opportunity Systems, Incorporated under contract HEW-OS-74-85

The Office for Civil Rights (OCR) in the Department of Health, Education and Welfare, has conducted an annual survey of public school districts every year from 1968 through 1974. This Fall Elementary and Secondary School Civil Rights Survey has focused on those issues which have been of greatest interest and direct responsibility for OCR during those years in which it was conducted. The particular questions that have been asked and the particular districts which have been surveyed have changed over the several years of the survey to reflect the specific needs and requirements of the office. When using the survey data files, it is important to realize that these surveys have been designed to support OCR in the compliance monitoring responsibility rather than providing a continuous survey coverage of the school districts in the United States. This has resulted in widely varying coverage rates, variations in coding schemes, and variations in the specific questions and methodology that has been employed. There has been no attempt, either implicit or explicit, to systematically track all of the school districts in the United States. Furthermore, there has been no attempt to systematically track a select subset of school districts in the United States over time.

The general survey methodology has remained basically the same throughout the several years of the survey and it is worth knowing this if one is to successfully use the resultant data files. The basic unit of survey has been the school district. School districts are chosen on a variety of bases, sometimes random, sometimes based on compliance involvement, etc. However, once a school district is chosen for inclusion in the specific survey then every individual school in that district is also covered. Furthermore, in some years select individual classrooms or class sections from the individual schools have been asked to respond. There are two basic survey instruments:

1. The School District Summary Form (CR 101)
2. Individual School Campus Report (CR 102)

The 101 form presents summary statistics and totals of the overall school district. In many cases this district summary form reports the totals which are also reported on an individual school basis on the 102 survey form. In other cases, the questions on the district summary form represents specific district questions which are not repeated or supported by individual school presentations of data.

In 1968, 1970 and 1972 the fall surveys covered a large number of school districts, generally about 8,000 separate school districts with between 70,000 and 75,000 individual schools. The selection methodology was as follows. All school districts with total enrollment greater than 3,000 were sampled with probability 1. All school districts with total enrollment between 1,200 2,999 were sampled with probability .75. All school districts with enrollment between 600 and 1,199 were sampled with probability .5. All school districts with total enrollment between 300 and 599 were sampled with probability .25. All school districts with populations below 300 were sampled with 0 probability. In addition, these various surveys were enriched with additional districts that were chosen because of their special compliance or other monitoring activity interest to OCR. This has resulted in some few school districts in the three large years with enrollments under 300 being covered. In 1969, 1971, and 1973 a "small" survey of high interest school districts was conducted. These small surveys were typically drawn as subsets of the previous large "even" years survey and covered approximately 3,000 school districts with between 35,000 and 40,000 schools. The school districts in these odd year surveys were generally selected on the basis of their high interest in compliance activity or their high concentrations of minority students.

In 1974 another small survey of 3,000 school districts was conducted. However, in this case the sample was randomly chosen in a manner that permitted proper statistical projection. In the previous odd year surveys, the sample

was not chosen in a manner which permitted statistical inflation to universe projections. The large even years, 1968, 1970, 1972, were, of course, proper samples which did permit universe projections. The 1974 sample was chosen according to a special sampling methodology that was developed for OCR to permit enrichment of the survey coverage to focus upon areas of high interest while at the same time maintaining controls over the number of districts covered and statistical projection capability.

In 1968, 1969, 1970, 1971 and 1972 these fall surveys asked questions - at both the district and school level - about two major areas:

1. Student enrollment by racial/ethnic groupings
2. Faculty assignment by racial/ethnic groupings

In 1973 and 1974 the responsibility for collecting faculty data was transferred to the Equal Employment Opportunity Commission and the OCR surveys were converted to pure enrollment surveys.

When using the survey files, it is important to know that not all fields have been edited in all years. Thus, it may well be that certain numerical inconsistencies exist between individual components of totals and the totals themselves. This inconsistency or error arises because the survey of that year did not require that full editing be done on individual data fields. Detailed examination of the editing history would be required if one were to attempt to use all of the data and rely upon complete arithmetic accuracy.

The data files themselves are stored in a special storage format that derives from an internal data storage and manipulation system which OCR utilizes. This attribute/value storage format is designed to provide a single storage approach for all of the survey files. From the OCR point of view, it considerably simplies data access, data analysis and general data manipulation. OCR makes available to the users of the data files a FORTRAN subroutine which can be used to read every year's survey file without having to worry about the particulars of the file layout or record structure. The data base is organized

in a listing fashion with an array orientation. Thus, the individual slots of each logical record are assigned specific meaning corresponding to the particular data element which is stored in them for that year. This list, or directory, is essential before one can use the data files. There exists various OCR documents which constitute the list assignment of attributes, called directories, that detail the individual slot or position identification. The overall record methodology has required that no slot should have different meaning in different years. Thus, for example, slot position 43 contains the total number of schools covered in an individual district for all years, 1968 through 1974. Because of this approach, there are many slots which are not defined for a record in a particular year but it never happens that a slot has two different meanings depending on the year of the record. This considerably simplifies any data extraction and analysis which is performed. (Because of the special differential storage approach, this seeming squander of storage space is only seeming and does not, in fact, take any additional storage space.)

The best approach to reading these data files is the use of the FORTRAN subroutine INITEM which requires a single initialization call and then a running call for each additional record which is desired. Exhibit A shows FORTRAN code needed to use INITEM to read an LDMS file.

There is an implicit hierarchy of record types for the information on the data file. The district record, which is designated as record type 1, always comes first. The district record is then followed by the individual school records for each and every school in that district. The school records are designated as school type 2. In those years where individual classroom records have been created, all of the classroom records for individual schools follow the corresponding school. The classroom records are designated record type 3. The general organization of the data file is as follows. The school districts are identified by the district OE code. The district OE code is a seven digit codes which has two components.

The first two digits are the state sequence code starting with 10 for Alabama and running alphabetically by 1's through the entire country ending up with number 61 for Wyoming. The next five digits represent the district OE code within state which was originally an alphabetic sequence number for the district within that state. However, with changes, consolidations, and revisions in the OE universe, these OE district codes cannot be depended upon to provide the correct alphabetical sequencing of the districts. All of the files are in OE district sequence which means that the first district is usually one from Alabama and the last district is usually one in Wyoming. Then, within each district, the schools are arranged by their school sequence number. For 1970, 1971, 1972, 1973, and 1974 the school sequence number which was used is the school OE code which is the five digit number. For 1968 and 1969 a separate ad hoc sequence number has been used to identify the schools. All schools are in numerical sequence for their identification following the district record in which they belong. Lastly, in those years where are classroom records, principally 1971 and 1972, the selected classroom records follow their school in order of the ad hoc section number which has been assigned to them.

It is important to know that while considerable effort has been made to maintain consistency of identification codes across years, that there is no guarantee that this will be so. The district OE codes tend to track with fairly high reliability although there are some few exceptions and inconsistencies. However, the school identification codes do not track anywhere near so well with perhaps as high as 10 or 15% disparity on a year to year basis for the individual schools. The classrooms from 1971 to 1972 bear no relationship to each other whatsoever in terms of the coding sequence.

OCR Directory and Data Base

Table of Contents

I. Structure and Content of OCR School Survey Data Base

II. The OCR School Survey Directory; its Relationship to the OCR Data Base and to LDMS

III. OCR School Survey Forms Cross-referenced to the OCR Data Base by Attribute Number

IV. OCR School Survey Forms Cross-referenced to the OCR Data Base by Attribute Name as found in the Directory

V. Numbered OCR Directory Cross-referenced to the OCR School Survey Forms

I. Structure and Content of the OCR School Survey Data Base

To understand the OCR School Survey Data Base, the user should first become familiar with the kinds of data collected by the Office of Civil Rights during its annual survey of elementary and secondary schools. Samples of the 101 and 102 forms used to conduct this survey for each of the years -- 1968, 1969, 1970, 1971 and 1972 are found in Sections III and IV of this document. If we were to proceed to examine these forms, one by one, and to make a list of names where each name describes a unique data element and where no data element has more than one name even if it is collected every survey year, then in large part we would have a description of the contents of one record in the OCR Survey Data Base. However, because not all data elements for a given survey year were key-punched or entered on data files at the time, some elements do not, in fact, actually occur on data base records. Moreover, some data not actually collected on the survey forms does occur on records of the data base. Examples of such data are the Office of Education School System Code, the state code, the assurance code, a code for the survey year, and so forth. Such data as these have been placed on data base records to facilitate report processing.

Consider now what has happened to the data collected on a given 101 or 102 form. It has been placed in fields on a record in the data base according to the list of data element names we have compiled. For each data element in the list, we have placed the value of the data element (attribute) if it occurs on the form, or a zero if it does not occur on the form. Hence we have a record which is uniquely associated with that

form. This is not quite true of 1971 and 1972 102 forms. In these two survey years, data was collected for many sections or classrooms in a school. Hence, for each of these sections or classrooms a separate record was created in the data base. We might think, then, of each record in the data base as containing either school system level data from a 101 form, school campus level data from a 102 form, or school classroom/section level data from a 102 form as illustrated in Figure I-1 on the next page.

The description of data base records above omits or overlooks one very important fact about the data collected by OCR. That fact is that the data contained on 102 forms for school campuses and classrooms is relevant not only to the school campuses and classrooms but also pertains to the school system. Hence we would severely limit our reporting capability if we did not include school system level data from the 102 forms on all records for school campuses in the school system and for classrooms in these schools. Naturally, we have not placed the limitation on our use of the OCR data. Hence, Figure I-2 illustrates the actual content of records (items) on the OCR data base. This hierarchical structure of the data base allows us to do many kinds of reporting rather easily. If, for example, we desired a report of Principal and Assistant Principal Data by Ethnicity only for school systems enrolling at least 500 minority students, we would need only to look at records in the data base containing school campus data, since these records also contain school system data. If the data base had the structure described first, it would have to be in sort with the school system record occurring immediately before school campus records pertaining to the system so that the 500 minority student enrollment criteria could be exercised.

Unfortunately, if we stopped here with our data base description, it is apparent that an exceedingly large additional burden of data has been added to the data base over what might be required if school system data weren't added to all records, for example. This, however, is not actually the case because the data base records are actually physically recorded on the data base in attribute/value form differentially. This form is easy to understand if we consider first the conventional form of a record. Figure I-3 illustrates a pair of such records. Notice that even though the School System Data is exactly the same on both records, it is recorded on both records. The attribute/value representation of those same data base records is illustrated at the bottom of Figure I-3. Notice that each attribute (data element) has associated with it an attribute number and that that number precedes the attribute value on the record. The (-1, 0) pair of numbers flags the end of the record. In the second record, only those attributes whose values differ from the first record, need to be present. Hence, only SCHOOL NAME occurs. A (-2, 0) pair of numbers flags the end of the data base. The LDMS report generators have special readers which interpret such records and store the data in arrays in conventional form for the user. Thus, the user does not need to worry about the fact that his data is stored in this special form.

One last set of facts about the OCR data base is worth mentioning. It consists of five data sets -- one for each survey year. Within each data set the items (records) occur in alphabetical order by state. Within each state, the records pertaining to a given school system are together, with with the system level record first, school records next, and following each school record, the classroom records pertaining to the school. However,

the school systems are not in any special order within the state. The LDMS report generators are used to place the data in any order desired by the user.

⋮	⋮
ETC.	ETC.

Figure II-1

2. DYNAMIC ATTRIBUTES. Some attributes, such as names, have too many possible values to list each one in the directory. The values for such attribures are actually found on the data base itself. The SYSTEM NAME attribute illustrated in Figure II-1 is an example of such an attribute in the OCR data base. Each school system has a different name, so the name is actually placed on the data base (rather than a code to a name as in the case of the STATE attribute). Hence, in this case the value "EXAMPLE CITY" would actually be placed on the OCR data base.

3. NOLIST OR FIXED POINT ATTRIBUTES. Some attributes represent numerical quantities such as number of pupils, number of schools, and so forth where such quantities are frequently combined with other such numbers to produce totals, percentages, or other types of results possible with arithmetic manipulations of the data described by these attributes. The FLOATING ONE and SYS PUPILS-A I attributes in Figure II-1 illustrate this attribute type. Note that NOLIST indicates that the value is an integer number.

In addition to these three attribute types, there are two other types of attributes which have special meanings in the directory.

1. DUMMY ATTRIBUTE. Whenever DUMMY occurs as an attirbute name, it is being used to extend the size of the preceding non-DUMMY attribute in the directory. Hence the SYSTEM NAME attribute in Figure II-1 has been extended by three DUMMY attributes and hence takes four fields in the data base. Note that each data base field can only hold four letters of the school system name; this is the reason why the DUMMY attributes are needed. Note also that no attribute can occupy more than four fields

which is why the necessity of an attribute name like SYSTEM NAME 2 arose. These restrictions imply, of course, that the directory is used by the LDMS software. AVREGE, one of the LDMS report generators, in fact uses it extensively.

2. NULL ATTRIBUTES. Whenever a field in a data base item is not being used, and hence is always filled with a "0", the word NULL is used to indicate this fact. In Figure II-1 the ATTRIBUTE attribute is NULL and indicates that field 2 in the data base items is not used. Note that the name of a NULL attribute is completely left to the user's creative imagination.

A complete listing of the OCR School Survey Directory is found in Section V of this document where it is cross-referenced, for the user's convenience, to the OCR School Survey Forms -- 101 and 102. Close examination of this listing should clarify the notions of attribute name, attribute type, and attribute size as discussed in this section. Note that a number is given at the left side of each attribute name in the directory. In one of the LDMS report modules, namely RG-4, these attribute numbers are used in the report command language instead of the attribute names, which are used by the AVREGE report generator.

III. OCR School Survey Forms Cross-referenced to the OCR Data Base by Attribute Number.

This section presents the forms used by the Office of Civil Rights in 1968, 1969, 1970, 1971, and 1972 to collect data pertaining to school system compliance with civil rights laws across the United States. Numbers have been placed in the blanks on these forms where the school system or school campus actually placed data when the surveys were conducted. These are the attribute numbers which indicate the actual location of the data on records (elsewhere referred to as items) in the data base as seen by the user. The forms are in order by survey year beginning with 1968, and within year the School System Report is followed by the School Campus Report which is, in turn, followed by the Classroom Data continuation sheet to the School Campus Report (for 1971 and 1972 only).

REPORTING REQUIREMENT:
This report is required pursuant to the HEW Regulation (45 C.F.R. 80) issued to carry out the purposes of Title VI of the Civil Rights Act of 1964. Section 80.6(b) of the Regulation provides:

Compliance Reports. Each recipient shall keep such records and submit to the responsible Department official or his designee timely, complete and accurate compliance reports at such times, and in such form and containing such information as the responsible Department official or his designee may determine to be necessary to enable him to ascertain whether the recipient has complied or is complying with this Regulation

II. The OCR School Survey Directory; Its Relationship to the OCR Data Base and to LDMS

A directory is simply a list of all the attributes which may have values in an item of a data base. Hence, the OCR School Survey Directory contains the attribute name for every district element of data which may have a value in an item of the OCR School Survey Data Base. The attribute names occur in the same order in the directory as the values which the attributes take occur in an item of the data base. This concept is illustrated in Figure II-1 for a set of attributes and their values.

In addition to assigning a reference name (attribute name) to each element of data in a data base, the directory also defines the size and type of value of each attribute. For some attributes, the directory also provides a list of allowed values, and names which sould be associated with the values. There are basically three different kinds of attributes represented in the directory; each has a distinct type of value.

1. LISTED ATTRIBUTES. Those attributes which have a modest number (usually less than 200) of possible values can have all these values listed in the directory. The sense in which the values are listed in the directory is that the names which are associated with the values are listed. In Figure II-1, the attribute ITEM TYPE is such an example. In the data base it can take only one of three possible values -- 1, 2, or 3. The meaning of these values is indicated by the value names in the directory. A "1" means the data base item is a "DISTRICT" item, and so forth. Another LISTED attribute in the OCR data base is STATE which has 51 possible values. It is attribute 178 and can be found in the complete directory listing in Section V of this document.

REPORTING REQUIREMENT:

This report is required pursuant to the 1970 Elementary and Secondary Education Act and the regulation (45 CFR 80) issued by the Department of Health, Education and Welfare pursuant to Title VI of the Civil Rights Act of 1964. Section 80.6(b) of the Regulation provides:

Compliance Reports. Each recipient shall keep such records and submit to the responsible Department official or his designee timely, complete and accurate compliance reports at such times, and in such form and containing such information, as the responsible Department official or his designee may determine to be necessary to enable him to ascertain whether the recipient has complied or is complying with this Regulation.

DUPLICATE—RETURN TO OFFICE FOR CIVIL RIGHTS (DATA BRANCH)

REPORTING REQUIREMENT:

This report is required from each of the following recipients of Federal assistance who are subject to the provisions of Title VI of the Civil Rights Act of 1964, Section 601, and the Regulation prescribed:

Compliance Reports. Each recipient shall keep such records and submit to the responsible Federal official or his designee timely, complete and accurate compliance reports at such times, and in such form and containing such information, as the responsible Department official or his designee may determine to be necessary to enable him to ascertain whether the recipient has complied or is complying with this Regulation.

F. Full-time professional instructional staff who [illegible] this school system between [illegible] 1971 and September 30, 1972							
G. [illegible] vacancies in FULL-TIME professional [illegible]			☐				
X. PART-TIME PROFESSIONAL INSTRUCTIONAL STAFF (Working less than full time at this school campus)							

XI. Report the number of pupils transported at public expense to this school campus (see instructions) PUPILS NEEDED

XII. Does this school offer Departmentalized Instruction in English Language Arts? DEPART, ENGLISH (1) YES ☐ (2) NO ☐

XIII. PUPIL ASSIGNMENT WITHIN SCHOOL

This question may be omitted if the entire pupil membership at this school campus consists of only one racial/ethnic group - (only one entry in Item VI. Column 1 through [illegible]). However, if two or more racial/ethnic groups attend this school campus (Item VI, Cols. 1-5) the question must be completed.

PUPIL ASSIGNMENT WITHIN SCHOOL Answer question A or B below for grades 3, 6, 9 and 12 if taught here. If none of these grades are offered or if the school is partially ungraded, answer for the lowest grade offered (except grades [illegible] and kindergarten. Report the entire section if that section has at least one pupil in the grade [illegible]

A. For grades with self-contained classrooms (non-departmentalized instruction in English language arts), report the number of pupils in each class section by grade level and section number or other identification.

B. For grades with departmentalized instruction in English language arts, report the number of pupils in each English language arts section, separately by grade level and section number or other identification.

If the pupils in a grade have departmentalized instruction in English language arts and also self-contained classroom instruction, answer only B for that grade.

If the school is totally ungraded, see instructions.

Section V. Numbered OCR Directory Crossreferenced to the OCR School Survey Forms.

This section presents a listing of attributes in the order they occur in a data base item and in the Directory. For each attribute, it describes the sources of the attribute values in terms of the OCR 101 and 102 school survey forms for the 1968, 1969, 1970, 1971, and 1972 survey years. This should enable the user to readily determine what data is in the data base and for which years. The user should remember that the 101 form contains data at the school system level, and the 102 form contains data at the school campus level. In addition, in 1971 and 1972, the 102 form also contains data at the classroom level. It should be further noted that district items contain zeroes for attributes whose values come from the 102 forms, and school items contain zeroes as values for attributes referencing classroom level data contained on 1971 and 1972 102 forms.

1 ITEM TYPE .1 DISTRICT .2 SCHOOL .3 CLASSROOM	The value of the attribute has been set to 1, 2, or 3 on all items by Lambda personnel depending on whether the data in the item comes from the 101 form (School System Report), or classroom data section of the 102 form (in 1971 and 1972 only).
2 ATTRIBUTE FILL	Not used
3 ATTRIBUTE FILL	Not used
4 FIXED ONE FIXED POINT	An integer one has arbitrarily been placed on all data base items for use by LDMS report generators.
5 FLOATING ONE FLOAT	A decimal one has arbitrarily been placed on all data base items for use by LDMS report generators.
6 DUMMY FILLER	Not used
7 OE CODE-INTEGER FIXED POINT	The seven digit Office of Education School System Code for a given school system occurs in all district, school and classroom items for that school system. Lambda personnel added it to 1968 and 1969 items, and corrected it on 1970 and 1971 items. In 1972 it was placed on the items as the data base was created.
8 SYSTEM NAME DYNAMIC	The school-system name occurs on all items in the data base which pertain to a given school system, i.e., all district, school, classroom items for a school system contain the school system name. It comes from section I of the 101-School System Report forms in all five survey years and occupies 9 positions in the data base.

5 PLAN-299 OR LESS
6 C.O.-299 OR LESS

The assurance of compliance code occurs on all data base items for a school system. IN 1968,1969, 1970, and 1971 it was taken from the tape files of survey data for those years. The data was originally provided to survey contractors by the Office of Civil Rights. In 1972 the code was derived from the SELECTION CODE (commonly referred to as the litigation code by OCR). The 299 and 300 numbers refer to student enrollments.

2 PLAN-NO LITIG.
3 C.O.-PRIV. SUIT
4 C.O.-ALL OTHER
5 441/PLAN-PRIVATE
6 441/PLAN-OTH LIT

The litigation code occurs on all 1970, 1971, and 1972 data base items for a school system. In 1970 and 1971 it was taken from the tape files of survey data for those years. In 1972 it was derived from an expanded breakdown of litigation codes (called selection codes in this directory) provided by OCR.

185 SELECTION CODE
1 PLAN
2 C.O.
3 LITIGATION
4 441-50% SCHOOL
5 441-10% MIN ENR
6 441-ALL

The selection code occurs on all 1971 and 1972 data base items for a school system. For 1971 it was taken from the tape file of school system survey data and only 1, 2, 3, 4, and 5 are valid codes where 4 means and 5 means,
IN 1972 the codes were provided by OCR and placed on the data base by Lambda. Only 1, 2, 3, and 6 are valid codes in 1972.

4 4.

The Sampling Code is the inverse of the probability with which a school system was surveyed during a given year based on the previous years pupil enrollment. It occurs on all data base items pertaining to a given school system. It was derived from the SAG code for 1968, 1969, and 1971. In 1970 it was derived from the tape file of school system survey data. In 1972 it was provided by the program which actually determined the sample of districts to be surveyed.

The number of construction sites to be acquired occurs on all 1971 data base items pertaining to a given school. It comes from part A.2 of section XII on the 101 form.

The number of school buildings to be put under construction occurs on all 1971 data base items pertaining to a given school system. It comes from part B.1 of section XII of the 1971 101 form.

The number of school buildings improved to increase student capacity occurs on all 1971 data base items pertaining to a given school system. It comes from part B.2 of section XII on the 1971 101 form.

These attributes parallel exactly the data in section VII of the 1969, 1970, and 1971 101 forms. They occur on all data base items pertaining to a given school system. It is possible that this data may not actually be present on items for 1969 and 1970, but this hypothesis has not been tested.
