FOREWORD

The agricultural and rural sector in Bangladesh has particular importance for the sustained food and livelihood security of its large, dense and ever-growing population. The agricultural activities in the country are pursued intensively for the crop as well as allied sectors and in conditions of scarce natural resources. The performance of this sector has great impact on macro-economic situation like employment generation, poverty alleviation, food security and nutritional attainment etc.

I deeply feel that statistics has been playing an ever-increasing role in shaping up and providing scientific information that is useful in almost every aspect of human life and beyond. Agriculture statistics is a major concern not only for Bangladesh but also for the world as a valuable assistance for formulation of appropriate policy and strategic plan in boosting up the food security and rural development. It is praiseworthy to mention that Bangladesh has a strong agriculture structure which has enabled the country to achieve food sufficiency. Agriculture alone has been playing a vital role in the national economy and has a persistent contribution to GDP of Bangladesh over the years.

I am happy to know that Bangladesh Bureau of Statistics is going to publish the Yearbook of Agricultural Statistics-2014 which is 26th issue in the series.This annual publication highlights data on crops area and production, crop damage, weather indicators, agricultural inputs, livestock, fisheries, forestry, prices of selected crops and export-import data on agricultural products.

The Yearbook of Agricultural Statistics-2014 covers a wide spectrum of statistics and indicators belonging to several thematic topics to serve as a reference guide to policy-makers, economists, analysts, academics, educationists, researchers and other users. I hope this publication will be very useful in understanding the wide variety of perspectives of this sector.

I appreciate the work carried out by Bangladesh Bureau of Statistics (BBS) and would like to express my sincere thanks to Mr. Mohammad Abdul Wazed (Additional Secretary) Director General, BBS for his active stewardship in this case. I also acknowledge hard works and the sincere efforts of officials of Agricultural Wing of BBS who were involved in this exercise. I expect that the users shall continue providing valuable feedback and suggestions for further improvement of such publication since BBS has been striving for excellence.

PREFACE

The Yearbook of Agricultural Statistics is an annual publication published regularly by the Bangladesh Bureau of Statistics (BBS). Agriculture Wing of Bangladesh Bureau of Statistics is responsible for accumulating, compiling and disseminating current crop statistics and other agriculture related data. This report contains statistics on crop production estimates, estimates of crop damage, meteorological data, agricultural inputs, results of Agriculture Census 2008, livestock, forestry, fisheries, crop prices, monthly wage data, land use, irrigation, exports and imports of agricultural products and inputs.

I would like to extend my sincere thanks to all officers and staff of Agriculture Wing for their hard work in preparing this publication.

I hope this Yearbook will be very useful to the planners, researchers, policy makers, NGOs, development partners and other users in their endeavours towards the agricultural development of the country. Any comment and suggestion for further improvement of this publication will be highly appreciated.

INTRODUCTION

1.1 Introduction

Bangladesh is predominantly an agrarian country. Due to its very fertile land and favorable weather, varieties of crops grow abundantly in this country. Agriculture sector contributes about 17 percent to the country`s Gross Domestic Product (GDP) and employs more than 45 percent of total labour force.

In order to determine evidence-based policy initiatives, agriculture related statistics are essential. The Yearbook of Agriculture Statistics of Bangladesh is an annual publication and source of this kind of statistics. Agriculture Wing of BBS accumulates compiles and disseminates current crop statistics and other agriculture related data. This Yearbook contains data on crop acreages and production, crop damage, weather variables, agricultural inputs like seeds, fertilizers, agricultural labour wages, irrigation, agriculture holdings, livestock, fisheries, forestry, prices of selected crops and statistics of export-import of agricultural products etc. The objective of this regular publication is to meet the users' demand of current agricultural statistics.

1.2 Method of Crop Production Estimation

1.2.1 Agricultural Statistics

Agricultural statistics consist of structural and annual statistics. The structural statistics are generated collecting data through full count/sample census normally at a regular interval of ten years as per FAO guidelines. The annual agricultural statistics are generated through annual /periodic sample surveys.

The Annual Agricultural Estimation System

The annual agricultural statistics system is designed to:

- Prepare estimate of acrage, yield per acre and production for 126 crops grown in the country ;
- Estimate of crop damages caused by floods, cyclonic storms and other natural calamities;
- Prepare monthly agriculture labour wage rate based on monthly agriculture labour wage survey.
- Prepare annual land utilization and irrigation statistics by districts. Prepare Irrigation statistics of different crops and crop details. and
- Compile the Yearbook of Agricultural Statistics, an annual publication of BBS;

1.2.2 Crop Estimation Reporting System

Selected sample clusters are visited four times in a year and crop-cutting experiment are conducted in due time to estimate the major crops production of Bangladesh. A well-defined Crop Calender is followed to collect data in the field level throughout the year. The collected data is processed, compiled at head office. The findings are disseminated after approval of competant authority.

1.2.3 Type of Estimation

Both subjective (household based interview) and objective (direct observation) methods are used to obtain crop estimates. The subjective method denotes the estimates based on impression. The objective method denotes the method of sample survey in which the main items of information are collected mostly through measurement and observation. The estimates of rice, wheat, potato and jute are made by objective method; for all other crops subjective estimation are followed.

1.2.4 The Subjective Estimation Method

Crop estimation is usually initiated at union levels. The upazila statistical office staff collects the union estimates of the area and yield rate of the crop being estimated. These crop estimates are prepared on the basis of assessment of opinions of farmers interviewed and appraisals of the current crop conditions compared with that of the previous year or of a normal year by the field staff of the upazila statistical office.

The Agricultural Censuses conducted in 1983-84, 1996 and 2008 influence the current estimates of crop areas.

In order to have an element of objectivity in estimation, the field offices of BBS collect area and yield rate of a crop by unions on the basis of assessments of reports of 5 local farmers and their observation of condition of crops in the field. Percentage changes of area of yield rate from previous year are determined on information collected from farmers and field staff's own observation of a crop. Thus, the ratio estimation methodology is followed to get current year estimates.

Upazila crop acreage is the arithmetic sum of union crop acreage and yield per acre is the result of weighted average of union estimates. District estimates are evaluated in relation to (1) prices of crops (2) seasonal characteristics, (3) conditions of the growing plants, (4) damages (if any) and (5) previous year estimates. The country estimates are based on district estimates.

1.2.5 The Objective Estimation Method

Cultivations of Aus, Aman, Boro, Wheat, Potato and Jute are widespread. The sample designs of these crops are, therefore, developed considering total land area of the country (excluding urban areas and areas under government reserved forests and big rivers) as universe. The each unit of clusters of plots are sampled across this universe. In order to conduct crop estimation survey for six main crops, BBS uses a total of 10348 clusters each constituted 5 acres of land on an average throughout the country as sample frame. The district is considered as the domain of estimation while the upazilas in a district are considered as strata. The clusters were allocadted among the districts proportionatly to the size of the district with restriction that the number of cluster in a district is at least 150. At least one cluster was chosen from each union of a upazila. The clusters were formed from cadestral plot listed in the land records. A cluster may have many crops & non-crops plots, each of which has it's own identification number referred to ID number. For each cluster, BBS maintains and updates the list of farmers having fields within the cluster as well as other relevant information regarding farming.

1.2.6 Data Collection

The clusters are visited 4 times a year. The acreages of different crops and other utilizations in each cluster are recorded by the field staff in prescribed forms.

1.2.7 Area Estimation

Sample designs for estimating the area of each six main crops: For each six crops, stratified two stage random sampling designs are used. The sample design for each main crop is as follows;
Area under particular crop in clusters is given by

$$P=\frac{area\ under\ the\ crop}{\sum_{i=1}^{Nd} ai}=\frac{a\prime}{\sum_{i=1}^{Nd} ai}$$

Area under particular crop (each six main crop) in district d is given by

$\hat{A}$d=NP

The cluster term reports are edited, compiled and analyzed in head office for estimating areas of Aus, Aman, Boro, Wheat, Potato and Jute crops by varieties separately and combinedly. The total acreage figure of a crop is obtained districtwise by using the method of ratio estimation. The acreage estimates of crops by district are obtained by ratio method of expansion as follows;

Area for a crop for the district	=	Effective area for the district	x	Area ratio devoted to the crop for the district

Where,

Effective area for the district	=	Total land area for the district	-	Area not utilized for agricultural purposes for the district

Area ratio devoted to the crop for the district	=	Sum of area devoted to the crop from plots within the clusters for the districts / Sum of areas of corresponding clusters for the district

1.2.8 Yield Rate Estimation

For estimating yield rates of the main crops (Aus, Aman, Boro, Wheat, Potato and Jute), sample crop cutting surveys are conducted. A large sub-sample of clusters is taken for each of the survey. The sampling design for yield estimation of each main crop is stratified two-stage random sampling design with different deistricts in the country serving as domains of study. Different upazilas are considered the strata. In each district 50 (fifty) sample crop cutting experiments are done in the sample cluster. The total number of crop cutting is distributed among the upazilas (sub-districts) according to the proportion of area coverage for each crop in the previous year. The first stage units (FSUs) of the sample design are the selection of clusters of land where crop is grown. A field (the smallest demarcated area in a cluster) in the cluster is the second stage sampling unit (SSU). A plot (crop cutting area) in the field where the crop under study grown is reflected for conducting crop cutting experiment.

District Level Estimate

Weighted average yield of the crop in d-th district, $\bar{y}_d = \frac{\sum_h^L A_{dh}\bar{y}_{dh}}{\sum_h^L A_{dh}}$

is the estimator of rice yield for the district

Where, $\bar{y}_d$= average yield of crop in district d

A_{dh}= total crop area in h-th stratum of district d

$\bar{y}_{dh}$= average yield of crop in the h-th stratum of district d

The district level variance of yield estimator is given by

$$V(\bar{y}_d) = \frac{1}{A_d^2}\sum_h^L A_{dh}^2\left(\frac{1}{n_{dh}} - \frac{1}{N_{dh}}\right)S_{dh}^2$$

The district level estimate of variance is given as:

$$\hat{V}(\bar{y}_d) = \frac{1}{A_d^2}\sum_h^L A_{dh}^2\left(\frac{1}{n_{dh}} - \frac{1}{N_{dh}}\right)s_{dh}^2$$

The estimated percentage standard error at the district level is given as:

$$\widehat{CV}_d = \frac{\sqrt{\hat{V}(\bar{y}_d)}}{\bar{y}_d} \times 100$$

Where, N_{dh}= total of fields growing specific crop in h-th strstum of district d

n_{dh}= sample number of fields growing specific crop in h-th strstum of district d

A_d= total estimated area of specific crop in district d

S^2_{dh}= sample varience from h-th stratum of district d

National Level Estimate

The overall weighted yield estimate at the national level is given by:

$\bar{y} = \frac{1}{A}\sum_{d}^{D} A_d \bar{y}_d$

The overall estimate of variance is given by:

$$\hat{V}(\bar{y}) = \frac{1}{A^2}\sum_{d}^{D} A_d^2 \hat{V}(\bar{y}_d)$$

The overall estimated percentage standard error is given as:

$$\widehat{CV} = \frac{\sqrt{\hat{V}(\bar{y})}}{\bar{y}} \times 100$$

Sample Crop Cutting Method of Rice (Aus, Aman & Boro)

The method followed is a circular cut of total area 215.278 sq. ft. (20 sq meters) with a radius of 8.278 ft,. In sample plot selected following statistical procedure, one random point is determined and keeping that point in the centre, the circle is delineated by means of an appliance with an arm of fixed length (8.278 ft.) attached to it. A stylus is also attached for marking crop plants to be cut. Rice from the harvested sample plants is threshed and winnowed and green weights are recorded. For recording the moisture, moisture meter is used. In Bangladesh 14% moisture in the case of paddy is considered as standard after drying. The formula for conversion of produce of paddy into rice followed in Bangladesh is given below:

Rice$= paddy \times \frac{2}{3}$

Sample Crop Cutting Method of Wheat

The sample crop cutting is conducted in the selected plot in the cluster. The sample plot (area of crop cutting) is determined following statistical procdure. The method followed is a circular cut of total area 50 sq. feet (approx) with a radius of 4 ft. Wheat from the harvested sample plants is threshed and winnowed and green weight and weight after drying is recorded. Thus, the weighted yield of wheat per area is obtained.

Sample Crop Cutting Method of Potato

To conduct sample crop cutting for potato, a field in the randomly selected cluster is randomly selected. As potato is planted in rows, two rows are randomly selected among total. Then the area under selected row is measured through adding the leangth in feet of each selected row multiplied by the average width per row in the field. Afterwards the Potato for selected two rows are harvested and cleaned. Then taking the harvested area and the weight of harvested Potato into consideration, the yield rate per acre is estimated.

Sample Crop Cutting Method of Jute

The sample crop cutting is conducted in the selected plot of the selected cluster. The sample plot (area of crop cutting) is determined following statistical procdure. The method followed is a circular cut having total area of 50 sq. feet (approx) with a radius of 4 ft. The bundle of jute is kept under water for few days. After somedays the rotten Jute is separated from the stalks, cleaned and dried. Then the weight is taken and the yield per acre is estimated.

1.2.9 Production Estimation

Multiplying area and yield rate figures, production estimates of the crops are derived separately for each district. Country estimates are obtained summing up estimates of districts. Yield rates at country level are all weighted averages of district figures.

Location: Dinajpur, Rangpur, Gaibandha, Joypurhat and Bogra districts.

AEZ-28: Madhupur Tract

This region of complex relief and soils developed over the Madhupur Clay. The landscape comprises level upland, closely or broadly dissected terrace associated with either shallow or broad, deep valleys.

Eleven general soil types exist in the area; of which, Deep Red Brown Terrace, Shallow Red Brown Terrace soils and Acid Basin Clays are the major ones. The soils on the terrace are better drained, friable clay loams to clays overlying friable clay substratum at varying depth. Soils in the valleys are dark grey heavy clays. They are strongly acidic in reaction with low status of organic matter, low moisture holding capacity and low fertility level.

Location: Dhaka, Gazipur, Narsindi, Narayanganj, Tangail, Mymensingh and Kishoreganj.

AEZ-29: Northern and Eastern Hills

This region includes the country's hill areas. Relief is complex. Hills have been dissected to different degrees over different rocks. In general, slopes are very steep and few low hills have flat summits.

The major hill soils are yellow-brown to strong brown permeable friable loamy, very strongly acidic and low in moisture holding capacity. However, soil patterns generally are complex due to local differences in sand, silt and clay contents of the underlying sedimentary rocks and in the amount of erosion that has occurred. BrownHill soils are the predominant general soil type of the area. Organic matter content and general fertility level is low.

Location: Mainly in Khagrachhari, Chittagong Hill Tracts, Bandarban, Chittagong, Cox's Bazar, Habiganj and Moulvi Bazar districts, small areas along the northern border of Sherpur, Mymensingh, Sunamganj and Sylhet districts in central and south eastern Sylhet and in the east of Brahmanbaria, Comilla and Feni districts.

AEZ-30: Akhaura Terrace

This small region lies on the eastern border of Brahmanbaria and southwest corner of Habiganj districts. In appearance, the region resembles Madhupur Tract with level upland dissected by mainly deep broad valleys.

The main soils on the upland have strong brown clay which grades into red mottled clay substratum. The valley soils range from silty clay loams to clays. Deep Red Brown Terrace soil, Grey Piedmont soils and Acid Basin Clays are the major components of general soil types of the area. The general fertility including organic matter status is low. The soils are strongly acidic in reaction.

Location: Brahmanbaria district and minor area in Habiganj district.

All the physiographic units and agro-ecological zones are displayed separately on two maps (Map-1 and Map-2).

1.5 Land Levels in Relation to Flooding

The distribution of land levels in relation to seasonal flooding is shown in Map-3. The information has been provided in terms of depth of flooding phases. The terms used have the following meanings:

Highland (H)	: Land which is above normal flood-level.
Medium Highland (MH)	: Land which is normally flooded about 90 cm deep during the flood season.
Medium Lowland (ML)	: Land which is normally flooded between 90 cm. and 180 cm. deep during the flood season.
Lowland (L)	: Land which is normally flooded between 180 and 300 cm deep during the flood season.
Very Lowland (VL)	: Land which is normally flooded deeper than 300 cm during the flood season.

An additional class, Bottomland, is recognized for depression sites in any land level class which remains wet throughout the year. The Medium Highland land type has been divided into two subclasses: MH-1, normally flooded upto about 30 cm deep; and MH-2, normally flooded between 30 -90 cm deep. Neither these subclasses nor Bottomland are shown separately in the map.

It is important to realize that the depth limits between the depth of flooding classes are not as rigid as the definitions might suggest. Flood-levels in an area may, in fact, vary by as much as a metre or more over different years. They may also reach their peak levels for only a few days at a time during a particular year. They may also reach their peak levels for only a few days at a time during a particular year. What these classes indicate is the level of flooding which farmers expect when they decide which crops to grow in the kharif season on their different kinds of land, based on their long experience of cultivation on particular sites:

- Highland may be suitable for kharif or perennial dry land crops if the soils are permeable. Impermeable soils - or soils which can be made impermeable by puddling - may be suitable for transplanted Aus and/or Aman paddy if bunds are made to retain rainwater on fields.

- Medium Highland is suitable for crops which can tolerate shallow flooding, such as broadcast or transplanted Aus paddy, jute and transplanted Aman paddy. Early kharif dry land crops which mature before flooding starts can be grown on permeable soils, and late kharif and early rabi dry land crops on soils which drain in September-October.

- Medium Lowland is flooded too deeply for transplanted Aus or transplanted Aman paddy to be grown safely. Mixed broadcast Aus and deepwater Aman is a common practice; or long Aman seedlings may be transplanted if floodwater recedes early enough. Dry land rabi crops are widely grown on soils which drain in October or November.

- Lowland is flooded too deeply for broadcast Aus or transplanted Aman to be grown. Deepwater Aman is typically grown on such land (although the cultivation of irrigated Boro paddy on such land in the dry season now precludes the cultivation of deepwater Aman over considerable areas of lowland). Dry land rabi crops can only be grown if floodwater recedes before December.

- Very Lowland generally is too deeply flooded for even deepwater Aman to be grown (this is not necessary because of the depth of flooding but because of such associated characteristics as early flooding, rapid flooding

or wave action on large open bodies of water, as in the Sylhet Basin). Where cultivated, very Lowland is generally used for irrigated Boro paddy, either HYV or local varieties.

- Bottomland stays too wet for paddy to be sown broadcast. The traditional crop on such land is local Boro paddy, either not irrigated or irrigated by traditional low-lift irrigation devices. In a few other areas where flooding normally does not exceed about 1.5 m deep very long Aman paddy seedlings are transplanted early in the monsoon season.

The above flood-depth classes are shown on the map as subdivisions of the soil units. As with the soil units themselves, it must be realized that the information given on flooding characteristics is highly generalized. It is to be noted that several flood-depth classes can occur within a single village in floodplain physiographic units. But the map shows either the most extensive class (or classes) occurring in the soil unit (e.g., Highland or Highland and Medium Highland) or the range of classes which cover important areas within the unit if more than two classes occur (e.g., Medium Lowland to Very Lowland). Where two classes are named, the more extensive one is named first. Where a range of classes is indicated, they are referred in sequence from highest to lowest position in the landscape, regardless of their relative extents.

1.9 Physiography of Bangladesh

Bangladesh forms the largest delta in the world and is situated between $88^{o}10'$ and $92^{o}41'$ East longitudes and between $20^{o}34'$ and $26^{o}38'$ North latitudes. The great delta is flat throughout and stretches from near the foot-hills of the HimalayanMountains in the north to the Bay of Bengal in the south.

The vast plain is washed by mighty rivers-the Meghna, the Padma, the Jamuna and the Karnafuli and their numerous tributaries. Tropical monsoon rains drench the land and the rivers. Onrush of rain waters in summer overflows their banks flooding low and outlying areas every year.

The monotony of flatness has been relieved inland by two elevated tracts-the Modhupur and the Barind tracts, and on the north-east and south-east by rows of hilly forests. The great plain lies almost at sea level along the southern coast and rises gradually towards north. The maximum elevation above the mean sea level is 4034 feet at Keocradang Hill in Rangamati Hill district. The topography, however, variable and can be divided into the following five classes.

1. High Land

The area is relatively high and cannot hold waters during monsoon. Some waters are retained by raising "bandhs" around fields. The area spreads over Modhupur Garh in Tangail and Mymensingh district, Bhaoal's Garh in Gazipur and Dhaka district, Barind tract in Rajshahi Division, Lalmai area in Comilla and "Tilla" areas in Sylhet, Moulvi Bazar and Habiganj district.

2. Medium Highland

The land which is normally flooded up to about 90 cm. depth during the rainy season for more than two weeks continuously. The area spreads over Barisal division, major parts of Khulna division, northern part of Rajshahi division and parts of Gazipur, Narsindi, Noakhali, Feni, Lakshmipur, Comilla and Habiganj district.

3. Medium Lowland and Low Land

Medium Lowland is normally flooded between 90cm. and 180 cm. depths and low land is normally flood between 180cm. and 275 cm. depth during the monsoon season. The area spreads over major parts of Comilla, Brahmanbaria, Chandpur, Gopalgonj district and parts of Lahskmipur, Noakhali, Serajganj, Natore and Naogaon district, northern parts of Khulna and Bagherhat district, minor of Jessore, Kishorganj and Habiganj district.

4. Very Low Land

The land consists of haors, bills, canals and other low lying areas which looks like large lakes during rainy season. Depth of water may rise as high as 30 feet. In winter, waters dry up except in the centre. Most of the haors and bills lie in Sylhet division and in Kisoreganj and Netrokona district.

5. Hilly Land

The land spreads over Rangamati, Bandarban and Khagrachari Hill Districts, parts of Chittagong, northern parts of Mymensingh, north and southern parts of Sylhet division, eastern border of Comilla and north eastern strip of Feni district.

F.N They often differ slightly from the totals of the rounded figers of corresponding individual crops. Like wise, yield rates correspondto full figures of area and production and hence most cases they differ slightly from yield corresponding to rounded area and production figures.

Estimates of Aus Rice (husked paddy) 2013-2014

Introduction:

Aus is one of the major crops in Bangladesh. It has been contributing to food production in addition to other two rice (aman and boro) crops. The weather condition for aus cultivation was favourable in the growing stage this year.

In a subjective manner, farmers were interviewed on some management system of seed and fertilizer. They opined that the incentives provided by the government to grow more aus rice and the timely distribution of seed and fertilizer led to substantial higher production this year.

Area:

Total area under Aus crop has been estimated at 1.05 million hectares this year as compared to almost same area in the last year. The total area of this year and the last year of Aus by variety are as follows;

Table-1 : Estimates of Total Area by Type of Aus Crop

Variety	2012-2013		2013-2014		Percentage(%) changes over previous year
	Area (in acres)	Area (in hectares)	Area (in acres)	Area (in hectares)	
Local Aus	6,52,905	2,64,217	6,01,027	2,43,222	(-) 7.94%
HYV Aus	19,49,392	7,88,876	19,96,624	8,07,990	(+) 2.42%
Total Aus	26,02,297	10,53,093	25,97,651	10,51,212	(-) 0.18%

(Contd.)

Yield Rate:

Average yield rate of 2013-2014 has been estimated at 2.213 metric tons per hectare which is 8.00% higher as compared to that of last year. Estimates of yield rates by varieties and combined average yield rate of all varieties are as follows;

Table-2 : Estimates of Yield Rates by Type of Aus Crop

Total Aus	22.22	2.049	23.99	2.213	(+) 8.00%

Note: Above total figures are weighted figures

Production:

Total Aus production (husked paddy) of 2013-2014 has been estimated at 2.326 million metric tons as compared to 2.158 million metric tons which is 7.77 % higher than that of last year. Estimates of production by varieties and combined total of Aus are as follows;

Table-3 : Estimates of Production by Type of Aus Crop

Estimates of Aman Rice*(Husked)*, 2013-14

Introduction

Aman is one of the main crops in Bangladesh. It is the second largest rice crop in the country in respect to the volume of production while Boro tops the production. It is notable that the area coverage of Aman is the largest as a single crop and Boro remains the second. The production of Aman depends on the weather condition of the country and farmers usually cultivate Aman in their land.

In the year 2013, favourable weather condition prevailed all over the country from sowing to harvesting period of Aman. In a subjective manner, farmers were interviewed on some points relating to management system of seed, fertilizer and rural electricity supply. They opined that proper management and timely distribution of seed, fertilizer and uninterrupted supply of electricity led to a stable and substantial production of Aman rice. It is remarkable that the Aman production has been persistently higher since 2010.

Area:

Total area under Aman crop has been estimated 1,36,65,608 acres(55,30,253 hectares) this year as compared to 1,38,63,261 acres (56,10,158 hectares) of last year. The harvested area has decreased by 1.42% this year. Comparative area estimates are shown below:

Estimates of Boro Rice*(Husked)*, 2013-2014

Introduction

Boro is the most important and single largest crop in Bangladesh in respect of volume of production. It has been persistently contributing to higher rice production in last successive years. The weather condition for boro cultivation was favoruable in the growing stage this year.

In a subjective manner, farmers were interviewed on some points relating to management system of seed, fertilizer and rural electricity supply. They opined that proper managmement and timely distribution of seed, fertilizer and stable supply of electricity led to a substantial higher production boro this year. There was no loss of boro crop in this year

Area

Total area under boro crop has been estimated 1,18,37,334 acres (47,90,305 hectares) this year as compared to 1,17,62,572 acres (47,60,055 hectares) of the last year. The harvested area has increased by 0.64% this year. Comparative area estimates are shown below:

Estimates of Wheat, 2013-14

Introduction

The cultivation of wheat increases this year in Bangladesh in relation to previous year. Comparatively the less production cost with relatively more profit of the contemporary crops are considered as main reasons for increase of wheat cultivation. The weather condition was favourable during sowing and harvesting period in the survey year 2013-14.

In a subjective manner, farmers were interviewed on some points relating to management and distribution system of seed and fertilizer. They opined that proper management and timely distribution of seed and fertilizer led to a substantial higher production this year. At the same time no natural calamity was reported during potato cultivation and its harvesting. As a result, the area and yield rate has significantly increased, which contributed 3.84% increase in total volume of production.

Area

The total area under wheat crop has been estimated 10,61,602 acres (42,9,607 hectares) compared to 10,29,268 acres (4,16,522 hectares) of the last year. Comparative area estimates are shown below;

Estimates of Total Area of Wheat Crop

Crop	2012-2013		2013-2014		Percentage changes over previous year

Wheat	10,29,268	4,16,522	10,61,602	4,29,607	(+) 3.14 %

Yield

Average yield rate of wheat has been estimated 32.88 maunds per acre (3.033 metric tons per hectare) which is 0.66 % higher than that of last year. Comparison of estimated yield rates of wheat is shown below:

Note: Above “Total” figures are weighted figures

Production

Total production of wheat has been estimated 13,02,998 metric tons compared to 12,54,778 metric tons of the last year, which is 3.84 % higher. A comparative estimates of wheat production are shown below:

Estimates of Jute 2013-2014

Introduction:

Jute is an eminent cash crop of Bangladesh. Farmers of some regions cultivate jute on regular basis. In a subjective manner, farmers were interviewed relating to cultivation of jute. They opined that due to favourable weather condition, the farmers persistently cultivated jute this year. As a result, jute was cultivated more this year as compared to last year

Area:

Total area under jute crop has been estimated at 16,45,118 acres (6,65,743 hectares) this year which is 2.24% lower than that of last year. Comparative area estimates of jute crop of 2012-13 and 2013 -2014 are as follows;

Table-1 : Estimates of Total Area of Jute Crop

2012-13		2013-14		% Change over previous year
Area (in acre)	Area (in hectare)	Area (in acre)	Area (in hectare)	
16,82,903	**6,81,034**	**16,45,118**	**6,65,743**	**(-) 2.24%**

Yield Rate:

Average yield rate has been estimated at 4.52 bales per acre (11.170 bales per hectare) this year which is almost same in the last year. Average yield rate of this year as well as the last year are computed as follows;

Table-2 : Estimates of Yield Rate of Jute Crop

2012-13		2013-14		% Change over previous year
Yield rate per acre (Bales)	Yield rate per hectare (Bales)	Yield rate per acre (Bales)	Yield rate per hectare (Bales)	
4.52	11.175	4.52	11.170	(-) 0.04%

Note: Above total figures are weighted figures

Production:

Total jute production in this year has been estimated at 74,36,228 bales which is 4.90% lower than that of last year. Total production figures of this year and the last year are as follows;

Table-3 : Estimates of Total Production of Jute Crop

Production (Bales)		% Change over previous year
2012-13	2013-14	
76,10,585	**74,36,228**	**(-) 4.90%**

Estimates of Area, Yield rates and Production by districts and by divisions are furnished in the table appended.

Estimates of Potato, 2013-2014

Introduction

Potato is a prominent crop in consideration of production and its internal demand in Bangladesh. Potato cultivation has been getting popular over the last many years. The weather conditionfor potato cultivation was favourable during the sowing, growing and harvesting period of the survey year 2013-14. The area of local variety remained almost samewith regard to previousyear. It was found that the farmers were interested to grow more high yielding variety.

In a subjective manner, farmers were interviewed on some points relating to management and distribution system of seed and fertilizer. They opined that proper management and timely distribution of seed and fertilizer led to a substantial higher production this year. At the same time no natural calamity was reported during potato cultivation and its harvesting. As a result, the area and yield rate has significantly increased, which contributed 4.03% increase in total volume of production.

Area

Total area under potato crop has been estimated11,41,727 acres (4,62,032 hectares) compared to 10,97,503 acres (4,44,135 hectares)of the last year. A comparative area estimates of potato are shown below;

The squally wind of a Nor'wster/Tornado exerts tremendous pressure upon structures of the houses and trees. This pressure can be calculated by using the formula, $P = 0.004v^2$ where pressure P is in pound/ft^2 and velocity v is in mile/hr.
