Namibia Census of Agriculture

2013/2014

COMMUNAL SECTOR REPORT

November, 2015

Namibia Statistics Agency

Ministry of Agriculture, Water & Forestry

PREFACE

In the 2013/14 Agricultural Year, the Namibia Statistics Agency (NSA) in collaboration with the Ministry of Agriculture, Water and Forestry, conducted the Agricultural Census. The census collected detailed data on crop production, crop storage, livestock production, and fish farming. The census was extensive in its scope and coverage as it provides data that can be disaggregated at regional level.

The census covered both the Communal Agriculture and Commercial Agriculture Sectors, however only results of the Communal Sector are reported in this publication. This report contains only basic analysis and it will be followed by Regional profiles and other technical documents in the subsequent months.

The extensive nature of the census, in relation to its scope and coverage, is a result of the increasing demand for more detailed information to assist in the proper planning of the agricultural sector and in the administrative decentralization of planning at regional level. It is hoped that this report will be a tool to be used to provide new insights for planners, policy makers, researchers and others involved in the agricultural sector, in order to provide evidence based solutions to the challenges faced in the sector.

On behalf of the Government of the Republic of Namibia, I wish to express my appreciation for the financial support provided by the development partners, in particular, the Food and Agriculture Organization (FAO) of the United Nations and the African Development Bank (AfDB).

I would also like to acknowledge the enormous efforts made by the planning team composed of professionals from the Namibia Statistics Agency and the Ministry of Agriculture, Water and Forestry (MAWF). My appreciation also goes to all those who in one-way or the other contributed to the success of the census.

The respondent households of Namibia are herewith also appreciated for providing information to the field staff of the NSA, without which this census would not have been conducted efficiently.

I would finally like to extend my sincere gratitude to all the professionals, the consultants, National and Regional Supervisors and field enumerators for their commendable work. Certainly without their dedication, the census would not have been successful.

Sikongo Haihambo

Acting Statistician General

LIST OF TABLES **7**

LIST OF FIGURES **9**

LIST OF ACRONYMS **10**

EXECUTIVE SUMMARY **11**

CHAPTER 1: INTRODUCTION **13**

1.1. BACKGROUND 13

1.2. OBJECTIVES 13

1.3. METHODOLOGY 13

1.3.1. Target population 13

1.3.2. Sample design 14

1.3.3. Sample size 14

1.3.4. Data collection and capturing 15

1.3.5. Procedures 15

1.4. RESPONSE RATE 16

1.5. RELIABILITY OF ESTIMATES 16

1.6. FINANCIAL AND TECHNICAL SUPPORT 16

1.7. PRESENTATION OF RESULTS 16

CHAPTER 2: AGRICULTURAL HOUSEHOLDS DEMOGRAPHIC CHARACTERISTICS **17**

2.1. Population size 17

2.2. Agricultural household population by age groups 18

2.3. Relationship of agricultural households members to head of household 19

2.4. Agricultural household population by main and secondary activity 20

2.5. Agricultural household population by level of education 21

CHAPTER 3: LAND USE **22**

3.1. Type of Holding 22

3.2. Means of Acquisition of parcels and Plots 22

3.3. Parcels and plots by ownership 23

3.4. Holding characteristics 24

3.5. Production and area of major crops 24

CHAPTER 4: ACCESS TO EXTENSION SERVICES AND FACILITIES **26**

4.1. Type of extension services 26

4.2. Source and type of information 26

4.3. Source of extension service 27

4.4. Households satisfied with extension service source 28

4.5. Distance to agricultural facilities 28

CHAPTER 5: EQUIPMENT AND INFRASTRUCTURE **30**

5.1. Means of transport 30

5.2. Storage facilities 30

5.3. Type of equipment owned 31

TABLE OF CONTENTS

CHAPTER 6: ACCESS TO CREDIT FACILITIES 33

6.1. Number of households who applied for agricultural loan 33

6.2. Purpose of loan received 33

6.3. Source and period of loan 34

6.4. Source of loan and type of collateral 35

CHAPTER 7: FARM MANAGEMENT 36

7.1. Use of fertilizers 36

7.2. Type of seed used 36

7.3. Use of pesticides 37

7.4. Use of irrigation 38

7.5. Type of inputs used 39

CHAPTER 8: AQUACULTURE/FISH FARMING 40

8.1. Fish farming 40

8.2. Fish farming system 40

8.3. Source of fingerlings and Fish stock 40

8.4. Partial fish harvest by reason 41

8.5. Period aquaculture had been practice 41

8.6. Practice of aquaculture by water type and source 41

8.7. Number of workers in aquaculture 42

CHAPTER 9: FORESTRY 43

9.1. Use of forest land 43

9.2. The purpose of agro-forestry 43

CHAPTER 10: FOOD SECURITY 45

10.1. Presence of food shortage 45

10.2. Number of meals taken per day 46

10.3. Months in which food shortage occurred 46

10.4. Reason for food shortage 47

10.5. Immediate response to alleviate food shortage 47

CHAPTER 11: OTHER ECONOMIC ACTIVITIES 51

11.1. Economic activities other than agriculture 51

11.2. Other income sources 52

CHAPTER 12: Labour Inputs 53

12.1. Agricultural household members by status of employment 53

12.2. Paid employees 53

12.3. Hired employees 54

CHAPTER 13: Usage and disposition of crops 56

13.1. Quantity disposed and use of crops 56

13.2. Quantity of crop production sold 56

13.3. Post-harvest losses 57

CHAPTER 14: Livestock 58
14.1. Livestock ownership 58
14.2. Cattle by type 59
14.3. Small stock by type 59
14.4. Domestic animals by type 61
14.5. Poultry by type 62
14.6. Livestock intake 63
14.7. Livestock Off-take 63
14.8. Livestock Losses 63
14.9. Feeding practice used 64
14.10. Pasture management system used 65

LIST OF ACRONYMS

AAS : Annual Agricultural Survey

ADC : Agricultural Development Centers

AfDB : African Development Bank

CAPI : Computer Assisted Personal Interview

FAO : Food and Agriculture Organization of the United Nations

HH : Household

MAWF : Ministry of Agriculture, Water and Forestry

NCA : Namibia Census of Agriculture

NSA : Namibia Statistics Agency

PPS : Probability Proportional to Size

PSUs : Primary Sampling Units

EXECUTIVE SUMMARY

Introduction (Chapter 1)

The Namibia Census of Agriculture (NCA) 2013/14 covered the communal and commercial farming sectors throughout the country. The objective of the NCA 2013/14 is to obtain baseline agricultural production and structural variables for the communal and commercial farming sectors at the national and regional levels. The census will provide statistics to improve planning and decision-making in the agricultural sector and satisfy the information needs of the socio-economic database being set up by the Namibia Statistics Agency (NSA).

Agricultural Households Demographic Characteristics (Chapter 2)

The estimated agricultural households population of 907 715 was made up of 490 149 (54.0%) female and 417 566 (46.0%) male headed households. The female agricultural population was more than male in all regions except // Karas, Erongo, Hardap, Omaheke and Otjozondjupa. Omusati has the highest agricultural population of 243 619 whereas Khomas has the least agricultural population of 259. The sex ratio for the agricultural population is 85, which means that for every 100 females there are 85 males.

The census indicates that almost 70 percent of agricultural population lives in large household sizes. A total of 386 896 agricultural population live in 6-9 persons households while 241 128 live in 10+ persons households. Most of the agricultural population were children under the age of 15 amounting to 352 934 persons. The majority of households were involved primarily in crop and livestock production which was reported by 265 927 and 38 214 agricultural households, respectively.

Land Use (Chapter 3)

There were 637 950 parcels of land of which 44 percent were acquired through clearing of land, 28 percent were inherited and 18 percent were acquired through local authorities.

The results revealed that 52 percent of the plots were managed by males while the females managed 48 percent of the plots. The combined total area of the major crops i.e. millet/mahangu, maize and sorghum is estimated at 463 248 ha. The total production for these crops were recorded as: 408 576 tonnes for millet/mahangu, 8 733 tonnes for sorghum and 55 986 tonnes for maize.

Access to Extension Services and Facilities (Chapter 4)

Agricultural households were asked to provide information on the type of extension services they received. About 8 040 agricultural households received extension services in the selection of crops, followed by 7 899 that received services in farm management and 7 621 that received extension services in livestock husbandry. Most of the extension services were provided by the Ministry of Agriculture, Water and Forestry. The census also showed that 31 720 agricultural households receive information through radio.

A large number of agricultural households (58.6%) are located within 1 km to facilities and 11.3 percent of the households were more than 10 km to facilities.

Equipment and Infrastructure (Chapter 5)

The census revealed that head loading was the main means of transport reported by 92 853 agricultural households, followed by 13 773 agricultural households that use Car or Pickup trucks and 5 188 households that use Donkey carts. Granary was reported as the dominant type of storage facility used in the country by 88 277 agricultural households.

Access to Credit Facilities (Chapter 6)

A total of 1 494 agricultural households applied for loans during the past 5 years and 1074 (72%) received the loans. The main source of loans was Agribank accounting for 23 percent of those who received. The main purpose of acquiring loans was for livestock cited by 31 percent of the agricultural households followed by 21 percent that took loans for the purpose of agricultural labour hire.

Farm Management (Chapter 7)

The households that reported to have used fertilizers on their crops mainly applied organic fertilizers. The majority of those using organic fertilizers, applied them on millet/mahangu.

Local varieties of seeds were used by 143 411 holders which makes them the most type of seeds used in the agricultural households. The reasons for not using improved and/or hybrid seeds were attributed to non-availability, and non-affordability and a lack of knowledge about these type of seeds.

Aquaculture/Fish Farming (Chapter 8)

The census findings showed that a total of 241 agricultural households practiced fish farming on their holdings. This activity is practised in four of the 14 regions, namely: Ohangwena, Omusati, Oshikoto and Zambezi. About 79 percent of these households started fish farming within the last three years.

Forestry and Food Security (Chapters 9 and 10)

Only one percent of households reported practicing agro-forestry. The census of agriculture revealed that only one percent of households reported presence of agro-forestry practices.

The census indicates that 76 percent of the households reported having experienced food shortages. A greater number of agricultural households experienced significant food shortage in January than other months. Loss of crops was the common reason for food shortage and was reported by 87 428 agricultural households.

Other Economic Activities (Chapter 11)

The census revealed that 294 715 household members were involved in economic activities other than agriculture. The highest number, 40 428 households reported that they are involved in wholesale and retail trade followed by 31 259 households who reported involvement in agricultural services.

Labour Inputs (Chapter 12)

A total of 609 211 agricultural household members were involved in agricultural activities, out of which 74 percent were permanently employed and 26 percent were engaged on a temporary basis. Most household members involved in agricultural activities were adult females accounting for 243 662, of which 192 344 (78.9%) were engaged on a permanent basis and 51 318 (21.1%) were engaged on a temporary basis.

The census further reported 100 414 paid employees of which 51 percent were males and 49 percent were females.

Usage and disposition of crops (Chapter 13)

The census revealed that the production of crops were mainly for own consumption. Millet/mahangu recorded the highest volume consumed (79 424 tonnes), followed by maize (11 132 tonnes) and sorghum with 4 512 tonnes. Millet recorded the highest post-harvest losses of 24 437 tonnes, of which 22 824 tonnes were lost in the field.

Livestock (Chapter 14)

The census reported that out of 159 484 agricultural households, 39 percent of them were engaged in livestock farming. A total of 872 228 cattle were reported of which 21.7 percent were owned by female household members. The census further recorded 1 618 204 goats and 163 905 sheep.

CHAPTER 1: **INTRODUCTION**

1.1. **BACKGROUND**

This publication presents the results of the 2013/2014 Namibia Census of Agriculture (NCA 2013/14), the third Agricultural Census to be conducted after independence. The 1994/95 Census was the first Agricultural Census taken after independence. From 1996 - 2003 Annual Agricultural Surveys were undertaken. The 2004/2005 Agricultural Census was planned and carried out but could not be published due to technical issues.

The Census of Agriculture 2013/14 used the modular approach thus strictly following the guidelines of the World Programme for the Census of Agriculture 2010 (WCA 2010). The aim of the WCA 2010 is to assist countries to meet the need for a wider range of data from the agricultural census, while minimizing the cost of census-taking.

Despite its marginal contribution to Gross Domestic Product (GDP), the agriculture sector in Namibia remains central to the lives of the majority of the population. Directly or indirectly, it supports the majority of the country's population. The sector can be divided into two distinct sub-sectors: the capital intensive, relatively well developed and export oriented subsector (Commercial); and the subsistence-based, high-labour and low-technology sub-sector (Communal).

1.2. **OBJECTIVES**

The immediate objective of the NCA 2013/14 was to obtain baseline agricultural production and structural variables for both the communal and commercial farming sectors at the national and regional levels. The long-term objective of the NCA was to provide data and statistics to improve planning and decision-making in the agricultural industry and satisfy the information needs of the socio-economic database being set up by the Namibia Statistics Agency (NSA).

Specifically, the NCA 2013/14 sought to:

a) Provide up-to-date and more reliable data on the numbers of agricultural holdings, land areas, crop production, livestock numbers, land tenure, land utilization, fertilizer usage, agro-chemicals, use of farm implements and machinery, farm population and labour force;

b) Provide detailed agricultural data such as number of holdings, total area of holdings, basic pattern of land utilization, area under crops and extent of irrigation;

c) Provide a sampling frame for subsequent agricultural surveys and other sample surveys on agricultural holdings; and

d) Provide data for estimating future trends/changes in agricultural behaviour through statistical projection models.

1.3. **METHODOLOGY**

1.3.1. **Target population**

The target population for the NCA 2013/14 consists of all the agricultural households engaged in both commercial and communal farming activities in the 14 administrative regions. However, only the results of the communal agricultural sector are presented in this report. Consequently, the target population for the communal sector survey consists of all the agricultural households in the rural communal areas of Namibia including the semi-urban areas around the urban centres.

1.3.2. Sample design

The NCA 2013/14 used a stratified two stage cluster sample design for the communal sector survey. At the first stage, primary sampling units (PSUs) were selected with Probability Proportional to Size (PPS) from the sampling frame based on the Enumeration Areas of 2011 Population and Housing Census. The size measure of a PSU in the sampling frame was the number of agricultural households which was derived from the questions included in 2011 Population and Housing Census as per the FAO recommendations. Table 1.1 shows the distribution of the agricultural households. The main strata was the regions which are also the primary domains of estimation. The frame units (PSUs) were further stratified implicitly by the constituencies within the regions. The list of agricultural households prepared within a selected PSU formed the secondary sampling frame from which a sample of agricultural households was selected systematically.

Table 1.1: Number of all households and the agricultural households by region (Communal rural and semi urban areas only)

Region	All households	Agricultural households (size measure)	Agricultural households Percent
!Karas	5,581	1,421	25.5
Erongo	3,634	1,832	50.4
Hardap	1,806	547	30.3
Kavango East	12,497	8,450	67.6
Kavango West	13,049	9,612	73.7
Khomas	864	191	22.1
Kunene	7,230	5,529	76.5
Ohangwena	40,038	35,138	87.8
Omaheke	5,564	2,334	41.9
Omusati	44,177	34,107	77.2
Oshana	21,368	16,350	76.5
Oshikoto	31,035	24,681	79.5
Otjozondjupa	6,121	3,267	53.4
Zambezi	14,800	9,193	62.1
Namibia	**207,764**	**152,652**	**73.5**

Source: Sampling frame based on 2011 Population and Housing Census

A third stage of sampling was introduced to measure objectively the average yields of the three major crops Maize, Sorghum and Millet for the purpose of estimating the production instead of the farmer's estimates. Hence a crop cutting experiment was conducted to measure the average yields of these crops. A list of plots under each of these crops in a sampled PSU was made using the plot information of the selected households within the PSU. These lists then formed the sampling frames for each of the crops in the PSU. Three plots were then randomly selected from each of the crop lists. If the list contained less than 3 plots then all were included in the experiment. An area was marked within the selected plot according to the FAO guidelines and the matured crop inside this marked area was cut and weighed when the crop was wet and dry. These figures were then used to estimate the average yields of each of the crops.

1.3.3. Sample size

A total sample size of 10,550 agricultural households was determined to give reasonably reliable estimates at the regional level for the most important variables. The proportional allocation of this sample did not yield the minimum sample sizes for some of the sparsely populated regions hence a power allocation with some adjustments had to be carried out as a compromise procedure while keeping the overall national sample fixed.

In general, 10 agricultural households were sampled from each of the selected PSUs thus having a larger spread of the sample across the population of agricultural households. However, in some of the southern regions having less communal farming activities, the sample size per PSU was raised to 16 agricultural households. Ultimately a total of 1,025 PSUs were covered in the survey. Table 1.2 shows the distribution of the sample.

Table 1.2: The distribution of the sample PSUs and agricultural households

Region	Sample PSUs	Sample Agricultural Households
!Karas	32	320
Erongo	24	384
Hardap	20	200
Kavango East	80	800
Kavango West	83	830
Khomas	8	80
Kunene	63	630
Ohangwena	159	1,590
Omaheke	26	416
Omusati	157	1,570
Oshana	109	1,090
Oshikoto	133	1,330
Otjozondjupa	49	490
Zambezi	82	820
Namibia	**1,025**	**10,550**

Note: Sixteen households per PSU for Erongo and Omaheke regions

1.3.4. Data collection and capturing

Data collection and capturing carried out during the NCA 2013/14 was done following international best practices. The enumeration was conducted face-to-face using Computer Assisted Personal Interview (CAPI) replacing the conventional paper questionnaire. This approach helped to minimize errors during data capturing and fast tracking data processing. In contrast, information on crop cutting was collected on paper forms and captured in MS Excel at a later stage.

The processing of the data was organized into three major phases namely:

- CAPI Data entry application design using CSPro 5.0;
- Data editing and data cleaning using Stata 13 and CSPro 5.0;
- Tabulation (summary tables) using Stata 13 and Excel

These phases were carried out over an 18 month period. Out of this period, the designing of tabulation programs, and the generation, verification and correction of tables lasted for 10 months.

1.3.5. Procedures

A technical subject-matter planning team, consisting of staff members from NSA and MAWF was established to guide the entire census process from planning to implementation. A two day user-producer workshop with various stakeholders was conducted where the draft questionnaire; structure of the census; census methodology; definitions and concepts; and the activity plan were discussed and agreed upon.

It was agreed in principle that the census will strictly follow the recommendations from the 2010 Round of the World Census of Agriculture (WCA) document of the FAO. The pilot survey was carried out during December 2013 and the survey instruments were finalized shortly after that.

In January 2014, a one week Training-of-Trainers (TOT) followed by a two week intensive training period for enumerators and team supervisors was conducted in four training venues. A team of four enumerators assigned to one supervisor were constituted and dispatched in the field across the whole country.

The Communal sector census was officially launched on 17 February 2014 and was conducted in two phases. The first phase which started on the 17 February 2014 entailed listing of all households and the interview that lasted for five days. The second, which started during May 2014 covered the crop cutting phase that was used as inputs in the calculation of the yield. The entire data collection in the field work lasted until end of July 2014.

A full publicity program was put in place to sensitize respondents and reduce non-response rate during the census. Each team started by paying a courtesy call to regional and local authorities in order to obtain support of leaders. In addition, rigorous publicity was done through the print and electronic media country-wide.

1.4. RESPONSE RATE

Response rates were computed for each region and the overall response was 95.9 percent.

1.5. RELIABILITY OF ESTIMATES

The estimates presented in this report were derived from a scientifically selected sample and the analysis of survey data was undertaken at national and regional levels. Standard Errors (SEs) and Coefficients of Variation (CVs) of some of the variables are presented in the Appendix of the main report to show the precision levels.

1.6. FINANCIAL AND TECHNICAL SUPPORT

The NCA 2013/14 was primarily funded by the Government of Namibia. In addition, the FAO provided financial and technical assistance through the Technical Cooperation Programme (TCP/NAM/3402) while the African Development Bank (AfDB) provided funds through the Statistics Capacity Building (SCB) Program.

1.7. PRESENTATION OF RESULTS

The NCA 2013/14 basic results are presented in terms of total numbers, averages and percentages of the different estimates.

2.1. Population size

The total population within the agricultural households for the communal sector was 907 715 of which 417 566 (46.0%) were male and 490 149 (54.0%) were female (Table 2.1 and Figure 2.1). The table shows that Hardap, //Karas, Erongo and Omaheke regions had the highest differences between the males and females population in the range of 15 to 28 percent as compared to the national difference of eight percent.

The highest number of agricultural household population for both sexes was recorded in Omusati region (243,619) with Khomas region recording the lowest number of agricultural household figures for both sexes at 259.

Table 2. 1: Size of population in the agricultural households by sex and region

Region	Total Agricultural household Population	Sex					Sex ratio
		Male			Female		
	Number	Number	%		Number	%	
//Karas	4 045	2 325	57.5		1 720	42.5	135

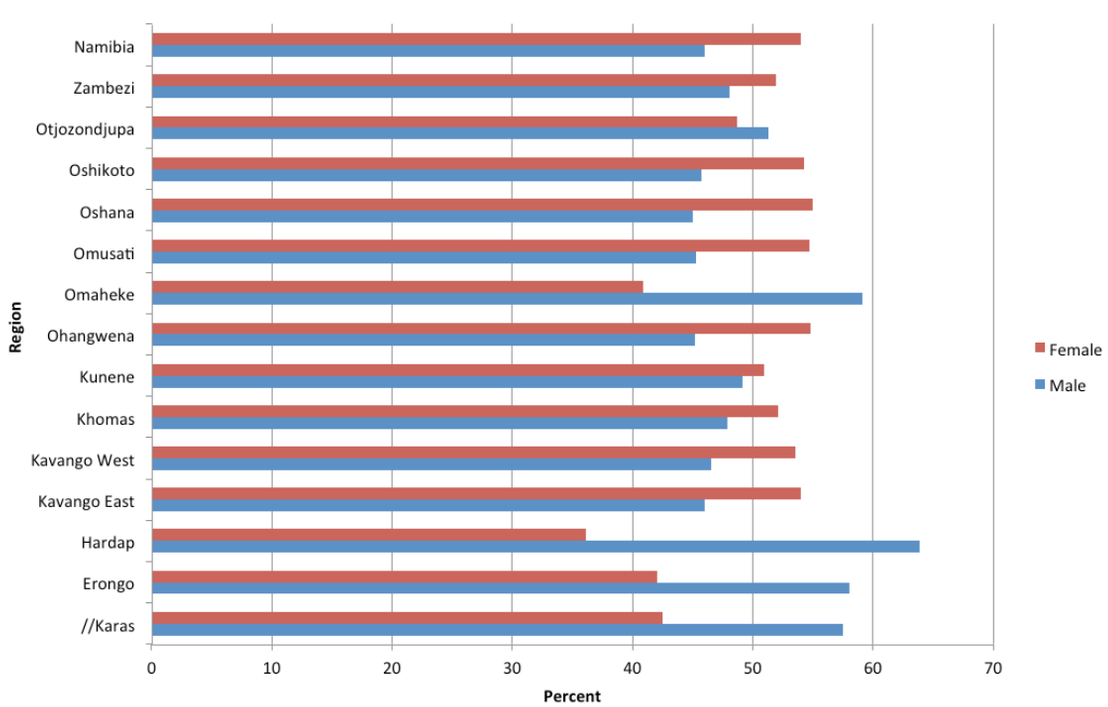

Figure 2. 1: Percentage population of agricultural household by sex and region

The Agricultural household members in the country were estimated at 907 715 out of which 241 128 live in households with 10 and more members (Table 2.2). Ohangwena region has the highest proportion of almost 30 percent of the population living in '10+ persons' households.

The results further show that the highest population of 386 896 live in '6-9 persons' households. Omusati and Ohangwena regions top this category with a population of 114 899 persons and 92 282 persons, respectively.

Table 2. 2: Number and distribution of agricultural household population by household size and region

Region	Total Agricultural Household Population	Household Size									
		1 person	%	2 - 3 persons	%	4 - 5 persons	%	6 - 9 persons	%	10+ persons	%

2.2. Agricultural household population by age groups

The distribution of agricultural household population by age groups and region presented in Table 2.3 shows that most of the household members (352 934) are below the age of 15, followed by 15 – 19 age group (130 478). With the exception of the 60+ age group which recorded 90 446 persons, the pattern shows a decreasing trend in all age categories up to the 55 – 59 age group.

Table 2.4 presents the distribution of agricultural holders by age groups and region. The results shows that out of 169 759 agricultural holders recorded, the highest number of 44 113 was recorded in Omusati region while the lowest number of 99 holders was recorded in Khomas region. The age group that recorded the highest figure of agricultural holders was the 60+ age group (67 096) followed by the 45 – 49 age group with 16 200 agricultural holders.

2.3. Relationship of agricultural households members to head of household

Table 2.5 presents the total population in agricultural households by relationship to head of households and region. The result indicates that the majority of the household members (273 739) were sons/daughters of the head, 269 278 were grandchildren, 97 311 were the other relatives of the head, while the spouses accounts for 55 015.

Table 2. 5: Total population in agricultural households by relationship to head of household and region

2.4. Agricultural household population by main and secondary activity

The results on agricultural household population by main and secondary activities are presented in Table 2.6 and 2.7. It is observed from Table 2.6 that out of a total of 316 129 agricultural population who reported for the main agricultural activity, the highest number of 265 927 agricultural population mentioned crop production as their main activity. Furthermore, livestock production was reported by 38 214 of the population as the second most important activity and this is followed by 4 468 of the population who reported trading as their main activity. Agricultural paid job outside holding and the Artisan also recorded 3 329 and 2 698 people respectively. The least activity is Horticulture with a population of 116.

As far as the status of the main activity is concerned, 149 471 of the agricultural population are Own account workers, 142 488 are Un-paid family workers with 15 912 population reporting to be paid workers.

The result further indicates that out of the population of 265 927 who reported crop production to be their main activity, own account workers accounted for the highest number of the population (127 247) as compared to the rest of the status of the main activity, a pattern which is replicated throughout the rest of the highlighted main activities.

Table 2. 6: Agricultural population by MAIN activity and status

Main activity	Status of main Activity					Total
	Own account worker	Employer	Paid worker	Un-paid family worker	Task worker	
Crop production	127 247	967	5 088	128 167	4 458	265 927

Namibia	**149 471**	**2 725**	**15 912**	**142 488**	**5 533**	**316 129**

With respect to the status of the secondary activity, the result in Table 2.7 indicates that out of a total of 197 341 persons who reported on the secondary economic activity, 125 728 were non-paid family workers of which 79 707 were engaged in crop production. Very few persons reported to being engaged in horticulture (470) and apiary (28) practices. In addition, 77 192 persons reported their secondary economic activity to be livestock production, out of which 30 816 (39.9%) were own account workers.

Table 2.7: Agricultural population by type of SECONDARY activity and status

Activity	Total	Status of secondary activity				
		Own account worker	Employer	Paid worker	Non-paid family worker	Task worker

2.5. Agricultural household population by level of education

The census also collected information on the highest level of education attained by the population of agricultural households. This information as presented in Table 2.8 shows that the majority of the agricultural household population (301 284) indicated primary education as their highest achieved level of education. Furthermore, 295 108 indicated secondary education as their highest achieved level of education, while 237 817 had no formal education. The regional analysis reveal that Omusati region recorded the highest number of persons with no education (58 353), primary (84 245) and secondary education (80 873) as their highest level achieved, followed by Ohangwena (57 820; 73 312 and 69 501) and Oshikoto (30 191; 42 191 and 45 083) regions respectively.

Table 2.8: Population 5 years and older in the agricultural households by level of education and region

3.1. Type of Holding

The census also collected information on the land use by the agricultural households. Table 3.1 presents the distribution of the population in the agricultural households by the number of holders, type of holding and region. A total of 169 984 agricultural holders were recorded, with the highest proportion of the holders (26.0%) found in the Omusati region. The least holders were in Khomas (0.1%), Hardap (0.2%) and Erongo and //Karas (0.7%) regions. With respect to the type of holding, the result shows that 104 610 holdings were mainly for crop and livestock only, 50 194 were recorded for crop, livestock and forestry holdings whereas 8 505 were for crop only holdings and 6 450 were for livestock only holdings.

On the regional distribution, the result shows that Ohangwena (23.3%) and Omusati (28.2%) regions recorded the highest number of holdings for 'crop and livestock only'. However, the situation is reversed in the 'crop, livestock and forestry only' where the proportions of holdings are 28.5 percent for Ohangwena and 24.9 percent for Omusati regons. Similarly, 'livestock only holdings' was more prominent in Omaheke (25.3% of the holdings) and Kunene (22.5 % of the holdings) regions, while 'crop only holdings' was prominent in the Kavango East with 21 percent of the total crop holdings. The results further show that only the regions of Otjozondjupa and Zambezi reported holdings for 'Forestry only' with 70.2 percent and 29.8 percent respectively.

Table 3. 1: Distribution of population in the agricultural households by number of holders, type of holding and region

Region	Total Population in Agricultural Households	Type of Holding											
		Number of holders	%	Crop only	%	Livestock only	%	Forestry Only	%	Crop & livestock only	%	Crop, livestock & forestry	%

3.2. Means of Acquisition of parcels and Plots

The results presented in Table 3.2 are the number and distribution of parcels by location, means of acquiring the plot and the period acquired. The results show that 637 950 parcels were recorded, of which the majority (280 826) were acquired through clearing, 177 217 were inherited and 111 681 were acquired through Local Authorities. Out of the cleared parcels, 6 148 are within constituencies whereas 2 413 are outside constituencies, while for the parcels that were acquired through inheritance, 4 449 are located within constituencies and 444 are outside constituencies.

Table 3.2 further indicates that 560 613 parcels were acquired over 3 years, whilst 61 198 parcels were acquired between 1 - 3 years and 16 139 parcels were acquired within a year. It is worth noting that for periods exceeding three years, 'Cleared' (248 490), 'Inherited' (155 624) and 'Use right from local authority' (101 067) happen to be the main means of acquiring parcels.

Table 3. 2: Number and distribution of means of acquiring the plot by parcels location, and period acquired

Means of Acquiring the Plot	Total	Location				Length of Period		
		Within Primary Sampling Unit	Within Constituency	Outside Constituency		Less than 1 year ago	1 - 3 years	Over three years
Inherited	177 217	172 324	4 449	444		5005	16588	155 624
Purchased	57 927	56 919	810	198		1683	7518	48 726
Cleared	280 826	272 265	6 148	2 413		6026	26310	248 490

Borrowed	6 225	6 059	127	39		465	1783	3 977
Rented	21	21	-	-		-	-	21
Other	45	45	-	-		-	-	45
Total	**637 950**	**619 883**	**13 582**	**4 485**		**16 139**	**61 198**	**560 613**

3.3. Parcels and plots by ownership

The census further collected information on the management of plots and parcels of which the resulting outcome are presented in Table 3.3. A total of 333 039 males own plots and parcels as compared to 304 911 females. Most of the plots and parcels owned by males and females are found within the PSU (324 894 for males and 294 989 for females). The majority of the males who own plots were in Omusati region (91 592), Ohangwena region (65 331) and Oshikoto region (58 654), a trend that is consistent with female owners where the majority were in the regions of Omusati (93 393), Ohangwena (68 131) and Oshikoto (51 761).

Table 3. 3: Number and distribution of parcels by sex of the plot owner, location and region

Region	Total male + female	Male				Female			
		Location of the Parcel				Location of the Parcel			
		Within Primary Sampling Unit	Within constituency	Outside constituency	Total male	Within Primary Sampling Unit	Within constituency	Outside constituency	Total female

3.4. Holding characteristics

The distribution of the agricultural households by the holding size and household size presented in Table 3.4 shows that out of the total 159 484 agricultural households considered, the majority (54 237) have 6 – 9 household members followed by 40 664 households with 4 – 5 household members while the least households (11 091) have one member household. With respect to the holding size, the majority of the agricultural households (58 909) have holding sizes exceeding 10.01+ ha, with the least (6 050) having holding size of 0.51 – 1.00 ha.

Table 3. 4: Distribution of agricultural households by size of holding and household size

Holding size (ha)	Total	Household size				
		One member	2-3 members	4-5 members	6-9 members	10+ members
< 0.50	8 834	1 584	2 822	2 215	1 854	359
0.51 - 1.00	6 050	864	1 582	1 726	1 471	407
1.01 - 2.00	12 148	1 339	3 447	3 479	3 085	798
2.01 - 5.00	32 569	2 333	7 818	8 361	11 107	2 950
5.01 - 10.00	40 974	2 118	8 352	10 699	15 130	4 675
10.01+	58 909	2 853	9 837	14 184	21 590	10 445
Total	**159 484**	**11 091**	**33 858**	**40 664**	**54 237**	**19 634**

With respect to land use area, the result presented in Table 3.5 shows that the number of households engaged in annual crop production is 141 952 covering on average an area of 3.68 ha per household. The results further show that 17 055 households use the land for grazing with an average of 8.23 ha per household and 4 223 households have wood land/forest with an average of 6.41 ha per household. On the contrary, only 48 households reported using land for tree crop, at an average of 0.19 ha per household. Land use for tree crop is only visible or recorded for holdings of size < 0.50 ha and 0.51 ha to 1.0 ha.

Table 3.5: Land use area and number of households by size of holding

3.5. Production and area of major crops

The area under crop production and yield by type of crop are presented in Table 3.6. It is evident from the table that millet/mahangu is the major crop for the majority of households (129 029) which is seven times more than the households that indicated maize (17 620) as a major crop and five times more than households that indicated sorghum 24 646 as their major crop.

With respect to the area under crop production, the majority of the areas remain under production of millet/mahangu (421 212.6 ha) with an estimated production of 408 576.22 tonnes (t). Similarly, sorghum is produced in 7 043 ha of land with an estimated production of 8 733.32 tonnes while maize came in third with an area of 34 991 ha and a production of 55 985.60 tonnes.

Table 3. 6: Area under crop production and yield by type of crop

Major crop	Number of Households	Area under crop (ha)	Yield (tonnes/ha)	Production (tonnes)
Maize	17 620	34 991	1.60	55 985.60
Sorghum	24 646	7 043	1.24	8 733.32
Millet/mahangu	129 029	421 212.6	0.97	408 576.22
Total		**463 247.6**		**473 295.1**

CHAPTER 4: ACCESS TO EXTENSION SERVICES AND FACILITIES

4.1. Type of extension services

During the census, agricultural households were requested to provide information on the type of extension services they received. Table 4.1 summarizes the number and type of extension services the agricultural households received. The results show that the majority of the agricultural households (8 040) indicated that they received services on the selection of crops, 7 899 households received farm management, 7 621 received livestock husbandry and 5 109 households received extension services on the use of inputs. Credit service was the least extension service received by the agricultural households as it was only reported by 609 households.

At regional level, Oshikoto region reported the highest number of agricultural households that received extension services across the services spectrum except for water irrigation and drainage where the highest number of households receiving this service was recorded in Omaheke region. In addition, Zambezi region recorded the second highest number of households who received farm management, selection of crop, input use and marketing services, while the //Karas and Hardap regions on average recorded the least numbers of agricultural households that reported to have received different types of Extension services (Table 4.1).

Table 4.1: Number of agricultural households by type of extension service and region

Region	Type of extension Services										
	Farm management	Selection of crop	Input use	Credit	Farm mechanization	Livestock husbandry	Plant protection	Environmental conservation	Marketing	Water irrigation and drainage	Other

4.2. Source and type of information

The Census of Agriculture collected information from the agricultural households on the type and source of the information they received. The results presented in Table 4.2 show that radio was cited by the majority of agricultural households to be the most used source of different types of information. For the agricultural households that reported receiving information through radio, 7 312 households receive information on Crop varieties followed by 5 632 households that received information on Livestock husbandry and diseases. However, internet was reported to be the least used source of information for households.

Table 4.2: Number of agricultural households by type of information received and source

Sources	Type of information													
	Weather	Crop varieties	New agricultural practices	Farm machinery	Credit facilities	Plant diseases and pests	Marketing	Rangeland management	Livestock husbandry & diseases	Agronomic practice	Water & Irrigation	Fish farming	HIV/ AIDS	Other

4.3. Source of extension service

The number of agricultural households receiving information by source of extension service and region presented in Table 4.3 reveals that the majority of the agricultural households (11 495) received information from MAWF's agricultural extension services, 7 608 received information from MAWF's veterinary staff, 2 689 households received information from the MAWF's rural water supply, whereas 1 122 obtain their information from farmers' union/cooperatives. Once again, internet as a source of information was the least reported by agricultural households accounting for only 66 households. At the regional level, Hardap and Khomas regions are the only regions having the least representation across the sources of the extension services.

Table 4.3: Number of agricultural households which received information by source and region

Regions	Extension Service Source

4.4. Households satisfied with extension service source

The census requested agricultural households to indicate whether they are satisfied with the extension services rendered by various service providers. The resulting outcome in Table 4.4 presents the number of agricultural households that are satisfied with the extension services by source and region. The result reveals that 10 524 agricultural households reported to be satisfied with MAWF agricultural extension services, while 7 247 agricultural households reported to be satisfied with MAWF Veterinary staff services.

Agricultural households that indicated satisfaction with the extension services offered by MAWF rural water supply were 2 401 while those that reported to be satisfied with the farmers union/cooperatives were 1 017 households. Services from the Agronomic Board were the least reported as they only account for the total of 67 households who indicated satisfaction with this service.

Table 4. 4: Number of agricultural households which are satisfied with extension services by source and region

Region	Source of Service

4.5. Distance to agricultural facilities

Distance to facilities was one of the information sought from the agricultural households during the census to measure access to facilities. Table 4.5 shows that over half of the agricultural households about 59% reside within a kilometer (km) of different agricultural facilities. Specifically, about 67 percent of the households reported to be within one km to the water point and 62 percent were within one km to the feeder roads.

In contrast, about 11 percent of the agricultural households were reported to live more than 10 km from the agricultural facilities. In particular, the results show that about 31 percent of the agricultural households reported to live more than 10 km from the regional produce market, 21 percent reported to live more than 10 km from the local produce market and a further 20 percent reported to live more than 10 km from the Agricultural Development Centre.

Table 4. 5: Percent of households by distance to facilities

Facilities	Distance to facilities						
	less than 1km	1 km	2 km	3 km	4-5 km	6-10 km	>10 km
Local produce market	53	4.9	4.3	4.2	5.5	7.4	20.7

5.1. Means of transport

Transport plays a significant role in the structure of food production and marketing, since good access to market can make a significant difference in the level of rural incomes.

Table 5.1 reveals that 92 853 households recorded head loading as their main means of transport, with 13 773 households reporting car or pick up as their main means of transport. Mules were the least main means of transportation reported by a single household.

In terms of source of accessibility, 120 882 households own their main means of transport, 4 179 borrow while 3 532 rent their main means of transportation.

Table 5. 1: Number and distribution of households by main means of transport

Means of Transport	Number of households	Source of main access				Number of transport facility owned
		Owns	Borrow	Rent	Others	
Head loading	92 853	91 452	398	334	669	n/a

5.2. Storage facilities

Crop storage entails keeping crops for a certain period of time as food for the household for sale at higher prices or as seeds for planting in the following season. Table 5.2 shows that granary was the dominant storage facility used in the country with 88 277 holdings reporting using it, followed by 46 919 holdings who use bags, while 23 186 reported drums as their storage facility.

With respect to the regional breakdown, Omusati region reported the highest number (36 607) of holdings using granary as a storage facility followed by Ohangwena region with 25 575 holdings and Oshikoto region with 14 418 holdings. Storage in bags is the dominant storage method used by 10 646 holdings in Kavango East region followed by 9 791 holdings in Kavango West region. Drums are mostly used in Ohangwena region where they account for about 7 075 holdings followed by Oshikoto region with 6 922 holdings.

Table 5. 2: Number and distribution of holdings reporting storage facility by region

Region	Type of storage facility

5.3. Type of equipment owned

Households were requested to provide information on the type of equipment, number of equipment owned, average number of equipment per household and years of ownership. Twenty-four different types of equipment were reported by the households. Under normal circumstances, every agricultural household should have the following basic equipment: Hoes/Etemo, Axes, Pangas/Machete, Sheller spade, Fork hoe, Pail, and Ox-plough. The results of the seven main types of equipment are provided in Tables 5.3, 5.4 and 5.5 while the details of all the 24 types equipment are provided in Annex A1-A3.

The results show that nearly all the agricultural households (97.99%), owned the seven mentioned main equipment (Table 5.3). In addition, households reported to own on average five Hoes/Etemos, three Pails and two of each type of Axes, Pangas/Machete, Sheller spade and Fork hoe (Table 5.4).

With the exception of Fork hoe and Pail, more than 90 percent of households who own these equipment, have had them for more than a year (Table 5.5).

The least used equipment were Planter (273 households), Weeder (491 households), Sprayer (600 households) and Harrow/cultivator (682 households). (Annex A1).

Table 5. 3: Number of agricultural households who reported use of agricultural equipment by type and ownership status

Equipment used	Ownership status				
	Owned	Rented	borrowed	Other	% owned
Hoes/Etemo	147755	329	1038	299	99
Axes	136445	424	1064	365	99

6.1. Number of households who applied for agricultural loan

The number of agricultural households who applied for loans during the past 5 years by region is presented in Table 6.1. The result shows that out of the total of 159 484 agricultural households, 1 494 households have applied for loans during the past 5 years (preceding the census) of which 1 074 (71.9%) households received loans.

The results further indicate that at regional level, Oshikoto recorded the highest number of households (331) that applied for loans, of which 255 (77%) households were successful. Furthermore, Ohangwena was the second highest region of loan applicants with 241 households, however, only 168 (69.7%) of the households received loans. The third highest region to have applied for loans was Omusati (231households) with 192 (83.1%) households getting the loans. Khomas region recorded the lowest number of loan applicants accounting only for five households of which four received the loans. However, when the total number of households were factored into the analysis, Erongo, Khomas and Omaheke regions have the highest applicants percentages (5.5%,5.3% and 4.8% respectively) as well as the highest recipient percentages (3.2%,4.3% and 2.8% respectively).

Table 6. 1: Number of agricultural households who applied for loan during past 5 years by region

Region	Total number of Agricultural households	Number of Agricultural Households who applied for Loan	Number of Agricultural households who received Loan	Number of Agricultural households who did not receive Loan
//Karas	1 253	27	23	4
Erongo	1 424	77	45	32
Hardap	459	14	9	5
Kavango East	9 760	72	22	50
Kavango West	10 026	26	11	15
Khomas	94	5	4	1
Kunene	4 909	81	73	8
Ohangwena	34 480	241	168	73

Omusati	43 339	231	192	39
Oshana	15 699	169	137	32
Oshikoto	23 984	331	255	76
Otjozondjupa	3 444	44	37	7
Zambezi	8 051	53	27	26
Total	**159 484**	**1 494**	**1 074**	**420**

6.2. Purpose of loan received

Most of the agricultural households(31%) that received loans in the past 5 years preceding the census reported to have received loans for livestock purposes (Table 6.2) Furthermore, 26.1 percent of the agricultural households reported to have received loans for other agriculture purposes, while 21.2 percent of households reported to have received loans for agricultural labour.

Table 6. 2: Number and distribution of agricultural households which received loan during past 5 years by purpose of the loan

Purpose of Loan	Number of Agricultural households that received a Loan	%
Agriculture labour	224	21.2
Seeds	143	13.6
Fertilizer	56	5.3
Livestock	327	31.0
Trading agricultural produce	14	1.3
Tractor	4	0.4
Borehole	12	1.1
Other agricultural purposes	275	26.1
Total	**1 074**	**100.0**

6.3. Source and period of loan

It is evident from table 6.3 that Agribank provided most of the loans (23.2%) to households of which 139 loan applicants received the loans for more than 3 years repayment period. Similarly, family and friends gave loans to 17 percent of the households, where the majority of the loan recipients (131 households) had the loan for less than a year. The result further reveals that 10.6 % of the households got loans under shelter/outside and 10.1 % got loans from micro finance institutions. The majority of these loans were for a period of less than a year in both instances.

Overall the loan period is predominantly less than one year (451 agricultural households) followed by between 1 and 3 years (314 households).

Table 6. 3: Number and distribution of agricultural households which received loan during the past 5 years by source and period of loan

Source of loan	Total number of agricultural households that received loan	%	Number of Agricultural households			
			Loan Period			
			Less than 1 year	Between 1 and 3 years	More than 3 years	Other
Agribank	249	23.2	51	39	139	20

Total	**1 074**	**100.0**	**451**	**314**	**200**	**109**

6.4. Source of loan and type of collateral

Agricultural households who were recipients of loans were also requested to provide information on the type of collateral. The results presented in Table 6.4 reveal that 420 agricultural households did not have any collateral, while 175 offered livestock as collateral primarily to under shelter/outside (50 households), Government (37 households) and Agribank (34 households). Similarly, 160 loan recipient households used third parties as collateral with 79 of them getting it through Agribank. Only eight households offered their land titles as collateral for their loans through Agribank.

Table 6.4: Number and distribution of agricultural households which received loan by source and type of collateral during the past 5 years.

Source of loan	agricultural HHs who received loan	% of total	Type of collateral						
			No collateral	Land Title	Crops	Livestock	Salary	Third party	Other
Agribank	250	23.3	26	8	-	34	30	79	73

7.1. Use of fertilizers

Fertilizers make crops grow faster and bigger so that crop yields are increased. They are minerals, which must first dissolve in water so that plants can absorb them through their roots. Fertilizers provide plants with the essential chemical elements needed for growth particularly nitrogen, phosphorus and potassium.

The number of agricultural households which applied fertilizer by type is given in Table 7.1 with most of the households (29 763) applying fertilizers on millet, with sorghum being the second highest crop type where fertilizers were applied (4 244 households). Similarly, 797 households indicated that they applied fertilizers to maize crop, 228 to ground nuts and 202 to beans.

With respect to the type of fertilizers used, there is a consistent application of both organic and inorganic fertilizers to crops such as maize, sorghum and millet, with millet having a consistent higher number of households applying fertilizers (over 80%). It is also of interest to note that most of the agricultural households are applying organic fertilizer to their crops as opposed to inorganic fertilizers except for tomato crops where only inorganic fertilizers were used.

Table 7.1: Number of agricultural households that applied fertilizer by type

Type of crop	Number of households applied fertilizer	Households applied Organic	Households applied Inorganic
Maize	797	448	384
Sorghum	4 244	3 202	1 119
Millet	29 763	22 883	8 404
Cabbage	15	15	-
Tomatoes	6	-	6
Water Melon	8	8	8
Pumpkin	6	6	-
Soya Beans	91	91	8
Ground Nuts	228	173	55
Beans	202	160	42

7.2. Type of seed used

Table 7.2 presents the number of holders by type of crops and the seeds they are using. It can be observed from the table that there is a consistent use of the local varieties of seeds for all the crops as opposed to the improved and hybrid seeds.

Table 7.2: Number of holders by type of crop and type of seed

Type of crop	Number of holders		
	Local seeds	Improved seeds	Hybrid seeds
Maize	14 456	2 705	171
Sorghum	20 154	1 710	75
Millet	107 196	23 573	1 490
Other Cereal	153	0	0
Vegetables	1 420	42	21
Fruits	32	3	0

Table 7.3 reveals that a high number of agricultural households do not use improved seeds mostly because they are not available (33 145 households), too expensive (32 754 households) or because they have no knowledge of them (30 728 households).

Furthermore, 6 999 agricultural households indicated that they do not use improved seeds as they do not see their usefulness. Such households are more in Oshikoto (2 758), Omusati (1 550) and Ohangwena (1 235) regions.

Table 7.3: Number of households not using improved seed by reason and region

Region	Total number of households not using improved seed	Reason not using improved seeds				
		No knowledge	Too expensive	Not available	Do not see usefulness	Others
Erongo	6	-	-	-	-	6
Hardap	3	-	3	-	-	-
Kavango East	8 815	2 419	4 178	1 989	36	193
Kavango West	9 766	2 098	4 226	2 787	266	389

Oshana	12 829	2 501	2 847	4 290	931	2 260
Oshikoto	19 394	3 714	5 109	6 155	2 758	1 658
Otjozondjupa	651	109	246	183	35	78
Zambezi	6 306	682	4 036	752	16	820
Total	**113 906**	**30 728**	**32 754**	**33 145**	**6 999**	**10 280**

7.3. Use of pesticides

The number of agricultural households that applied pesticides on crops by type of pesticides is presented in Table 7.4. The results show that most of the households 13 734 used other pesticides that are not fungicides, herbicides or insecticides on their crops. The use of other pesticides is more prominent with millet (10 388 holders), followed by sorghum (1 922) and maize (1 096). Insecticides were used by 634 holders of which 475 applied it to millet, 90 applied it to maize, 40 on vegetables while 29 households use it on sorghum.

Moreover, 164 households applied herbicides, whereby 139 used it on millet, 18 applied it on sorghum while seven households applied it on maize. For the 136 agricultural households which used fungicides, the majority of them (100 households) applied it on millet crops.

Table 7.4: Number of households applied pesticides by type of crop and type of pesticides

Type of crop	Number of holders applied			
	Insecticides	Herbicides	Fungicides	Other*
Maize	90	7	22	1 096
Sorghum	29	18	-	1 922
Millet	475	139	100	10 388
Other Cereal	-	-	-	25
Vegetables	40	-	14	282
Fruits	-	-	-	21
Total	**634**	**164**	**136**	**13 734**

**Other includes traditional methods of pesticides used*

7.4. Use of irrigation

Water is the limiting factor to crop production in most areas of Namibia and without water most of the other agricultural practices applied to crops will not result in a significant increases in yields. Table 7.5 reveals that 906 agricultural households use irrigation of which 562 (62 %) irrigate millet. Irrigation is used by 62.0 percent of the households on millet and 229 (25.3 %) irrigate maize crops

Table 7.5: Number and distribution of households who practise irrigation by crop type

Type of crop	Number of households practising irrigation	% of total households
Maize	229	25.3
Millet/Mahangu	562	62.0
Cabbages	38	4.2
Spinach	25	2.8
Fruits	12	1.3
Vegetables	40	4.4
Total	**906**	**100.0**

The results presented in Table 7.6 show that most of the agricultural holders use surface irrigation methods to irrigate their crops and the majority of them do not pay for irrigation water. The situation is more prominent in holders (437) who are irrigating millet and 143 holders who are irrigating maize.

Table 7.6: Number of holders by method of irrigation used on crop and payment

Type of crop	Number of holders who reported irrigation	Method of irrigation used			Payment for irrigation water	
		Surface	Sprinklers	Drip	Pay	No pay
Maize	242	143	21	79	89	153
Millet/Mahangu	549	437	78	33	72	477
Cabbage	38	23	15	-	6	32
Spinach	25	6	-	19	-	25
Water Melon	12	12	-	-	12	-
Pumpkin	12	12	-	-	12	-
Bean	24	24	-	-	10	14
Paw-paw	3	-	-	3	3	-

With respect to the source of water for irrigation, the results presented in Table 7.7 indicate that the majority of the households (27.2 %) use rural water supply as a source of irrigation. In addition, 22.6percent of the households get their water from River/Lake/Pond/Mountain/ by gravity and 21.7 percent get theirs from River/Lake/Pond/ by pumping. The least used source of irrigation was reported to be Waste water/semi purified water (3.2% of the households).

Table 7.7: Distribution of agricultural households which practice irrigation by source of water

Source of irrigation	Number of HHs practicing Irrigation	%
River/Lake/Pond/Mountain/ by gravity	107	22.6
River/Lake/Pond/ by pumping	103	21.7
Dam/Reservoir/Earth dam	23	4.9
Harvested	30	6.3
Borehole	40	8.4
Waste water/semi purified	15	3.2
Rural water supply	129	27.2
Canal	27	5.7
Total	**474**	**100.0**

7.5. Type of inputs used

The result in Table 7.8 presents the number of holders who used inputs by educational level and type of inputs. The table indicates that the number of holders using local seeds irrespective of their educational status is 111 601 followed by 25 392 holders who cited the use of improved seeds, while organic fertilizers were used by 22 485 holders.

With respect to the educational level, local seeds are predominantly used by holders with primary education (47 087), followed by holders with secondary education (29 442) holders, while those with no education accounts for 22 801 holders. This trend appears to be consistent with the use of other inputs by holders except for the holders using the hybrid seeds where by holders with the secondary education were in the majority (539) followed by holders with primary education (426) and those with no education (416).

Table 7.8: Number of holders who used inputs by educational level and type of inputs

Education level of Holders	Number of Holders by type of inputs						
	Local seed	Improved seed	Hybrid seeds	Organic fertilizer	Inorganic fertilizer	Pesticide	irrigation
None	22 801	3 896	416	4 067	1 201	2 908	136
Pre-primary	4 755	874	19	1 582	284	590	32
Primary	47 087	11 564	426	9 098	3 468	5 348	415
Secondary	29 442	7 370	539	5 781	2 418	3 000	223
Certificate	985	134	42	155	409	37	31
Diploma	1 739	320	66	462	107	222	3
Tertiary/degree	1 130	390	23	262	146	176	14

Total	**111 601**	**25 392**	**1 694**	**22 485**	**8 414**	**12 281**	**905**

Information pertaining to the main source of inputs was also solicited from the holders during the census. The result presented in Table 7.9 indicates that the majority of the holders (110 315) reported that they use their own inputs followed by 6 873 holders who reported to have to have obtained their inputs from markets, while the holders who use the Government as their supply of inputs were 4 331.

At regional level, the majority of holders (30 236) who use their own source of inputs were from Omusati region, while Ohangwena and Oshana regions have the highest number of holders (1 849 holders and 1 607 holders respectively) who make use of markets inputs.

Table 7.9: Number of holders by source of agricultural input and region

Region	Total number of holders	Main Source of supply inputs				
		Own	Markets	Cooperative	Government	NGO's
Erongo	6	6	-	-	-	-
Kavango East	8 643	8 068	336	82	133	24
Kavango West	9 367	8 784	357	73	116	37
Kunene	1 816	1 512	139	25	132	8

CHAPTER 8: **AQUACULTURE/FISH FARMING**

8.1. Fish farming

During the census, agricultural households were asked whether fish farming was practised on the holding. Out of the 14 regions, only households from four regions (Ohangwena, Omusati, Oshikoto and Zambezi) (as indicated in Table 8.1) reported to be engaged in fish farming.

The results show that a total of 241 agricultural households practise fish farming out of the 109 854 households which reported. In particular, Omusati region has the highest proportion (51%) of households practising fish farming followed by Oshikoto with 31 percent of households practicing fish farming, while Zambezi region has the lowest proportion of 6.2 percent of the households practising this type of farming.

Table 8.1: Distribution of agricultural household practicing fish farming by region

Region	number of agricultural HHs	Agricultural HHs with fish farming	% of Total HHs fish farming
Ohangwena	34 480	30	12.4
Omusati	43 339	122	50.6
Oshikoto	23 984	74	30.7
Zambezi	8 051	15	6.2
Total	**109 854**	**241**	**100**

8.2. Fish farming system

The distribution of agricultural households by fish farming system and average surface area of water bodies/pond is shown in Table 8.2. The results indicate that the still water culture (pond) system with an average surface area of 3m2 is used by 152 agricultural households while the running water culture system with an average surface area of 364m2 is used by 107 households and the cage culture fish farming system having an average surface area of 20m2 is used by 15 households.

Table 8.2: Distribution of agricultural household by fish farming system and average size of water bodies/ pond

Fish farming system	Number of HHs reported	Average surface area in m²
Still water culture (pond)	152	3
Running water culture	107	364
Cage culture (Dam)	15	20

8.3. Source of fingerlings and Fish stock

The census collected information on the number of fingerlings stocked by type as well as source of the fingerlings and the quantity of fish harvested during the past 12 months. The results summarized in Table 8.3 show that only 73 fingerlings were sourced from private traders, while 168 fingerlings were from other sources. With respect to the number of fingerlings stocked, the majority (2 976) were Carp which were stocked in all four regions, with 343 Tilapia stocked in all four regions except Ohangwena.

The total number of fish harvested was 1 721 with 922 harvested from Ohangwena, 582 from Zambezi, 157 from Omusati and 60 from Oshikoto regions.

Table 8.3: Number of fingerlings stocked by type, source and quantity of fish harvested and region during the past 12 months

Region	Source of fingerlings			Number of fingerlings stocked				Number of fish harvested
	Private trader	Other		Tilapia	Catfish	Carp	Other	
Ohangwena	-	30		-	-	680	115	922
Omusati	34	88		106	-	1 339	-	157
Oshikoto	39	35		179	60	608	60	60
Zambezi	-	15		58	58	349	146	582
Total	**73**	**168**		**343**	**118**	**2 976**	**321**	**1 721**

8.4. Partial fish harvest by reason

During the census, agricultural households were also asked whether they carried out partial harvest from the fish farms. Table 8.4 depicts the number of agricultural households who carried out partial fish harvesting by reason. A total of 106 agricultural households carried out partial harvesting of which 91 was for own consumption and only 15 households from Oshikoto region partially harvested their fish for marketing purposes.

Table 8.4: Number of agricultural households who carried out partial fish harvest by reason and region

Region	Total number of agricultural HHs	Agricultural HHs who Carried out partial fish harvest	%	Reasons for Partial Harvest	
				Own consumption	Marketing
Ohangwena	34 480	19	17.9	19	-
Omusati	43 339	17	16.0	17	-
Oshikoto	23 984	55	51.9	40	15
Zambezi	8 051	15	14.2	15	-
Total	**109 854**	**106**	**100.0**	**91**	**15**

8.5. Period aquaculture had been practice

Agricultural households were also asked to find out how long they have been practising aquaculture. The outcome summarized in Table 8.5 indicates that the majority of the households (190) have been practising aquaculture for the last three years, while only 32 households had been in practice for the last 10 years.

Table 8.5: Number of agricultural households who practice aquaculture by number of years and region

Region	Number of HHs reported	Agricultural HHs practising aquacullture		
		Since last 3 years	Since the last 5 years	Since last 10 years
Ohangwena	30	11	19	0
Omusati	122	105	0	17
Oshikoto	74	59	0	15
Zambezi	15	15	0	0
Total	**241**	**190**	**19**	**32**

8.6. Practice of aquaculture by water type and source

The distribution of agricultural households who practice aquaculture by water type and water source is presented in Table 8.6. It is evident from the table that most of the households (174) practice fresh water fish farming of which 107 use rain as the source of water. Similarly, 56 households practice brackish water fish farming where the majority of the households (39) use dams as water source.

Table 8.6: Distribution of agricultural households who practice aquaculture by water type and water source

Water Source	Total number of agric HHs who practise	Number of agric HHs who practice Aquaculture by water type		
		Fresh water	Brackish water	Other
Rain	135	107	17	11
Groundwater	52	52	0	0
Rivers /canal	15	15	0	0
Dams	39	0	39	0
Total	**241**	**174**	**56**	**11**

8.7. Number of workers in aquaculture

The census of agriculture collected information on the number of workers engaged in fish farming activities. Table 8.7 shows that 38 percent of workers were involved in feeding activities with 37 percent being males and 38 percent females. Similarly, 31 percent of the workers were involved in harvesting/fishing of which 30 percent were males while 32 percent were females.

Table 8.7: Number and distribution of workers who participated in fish activity by type of activity and sex

Type of fish farm activity	Total no of workers who participated	% of total workers	Number of workers who participated			
			Male workers	%	Female workers	%
Feeding	324	38	151	37	173	38
Water monitoring	138	16	69	17	69	15
Harvesting/Fishing	267	31	122	30	145	32
Watering and Cleaning	78	9	39	10	39	9
All of the above	52	6	26	6	26	6
Total	**859**	**100**	**407**	**100**	**452**	**100**

9.1. Use of forest land

This section discusses one of the important resources the country is endowed with, namely forestry. Forests conserves soil and water, maintains biological diversity, and provides many products such as woods and food. Without forests, large areas of Namibia would become deserts, and the people in those areas, and the country as a whole, would suffer in various ways.

Table 9.1 presents the estimates of area of forest land by type of land use. The table reveals that the primary land use covers about 1 387 081 ha which accounted for 607 132 ha of forest. Similarly that of secondary land use covers an area of 606 015ha, of which 233 317 ha covered in forest.

Table 9.1: Estimate of area of forest land by type of land use

Forestry type	Main use		
	Total Area in ha	Primary land use in ha	Secondary land use in ha
Forest	840 449	607 132	233 317
Other wooded land	1 152 647	779 949	372 698
Total	**1 993 096**	**1 387 081**	**606 015**

The census further revealed that 1 733 (1.1%) out of the 159 484 households reported practicing agro-forestry (Table 9.2), whereby the majority of these households were found in the region of Oshikoto (877 households). The presence of agro-forestry reported in //Karas and Khomas regions was found to be insignificant.

Table 9.2: Number and distribution of agricultural households reporting the practice of agro-forestry on the holding by region

Region	Total Agricultural HHs	HHs who reported forestry practices	Percent within regions
//Karas	1 253	-	-
Erongo	1 424	4	0.3
Hardap	459	6	1.3

Zambezi	8 051	132	1.6
Namibia	**159 484**	**1733**	**1.1**

9.2. The purpose of agro-forestry

The presence of agro-forestry was reported by 29 725 agricultural households (Table 9.3). The table further shows that multiple use was reported by the majority of the households (9 247) as the main purpose of practicing agro-forestry followed by 5 372 household who reported wood cover as the main purpose of use. Just 540 households reported the main purpose of agro-forestry to be for biodiversity.

Table 9.3: Number of agricultural households by main purpose of forestry

Main Purpose	Number of agricultural Households
Production	3 907
Soil and water management	1 206
Multiple use	9 247
Conservation	1 784
Sustainable livelihood	3 605
Wood cover	5 372

Fodder	1 537
Other	2 527
Total	**29 725**

10.1. Presence of food shortage

The 2013/14 Census of Agriculture collected information on whether there were times during the past 12 months that the agricultural household members were not able to obtain sufficient food to eat.

The findings presented in Table 10.1 show that 121 891 agricultural households experienced food shortages. The regions of Kavango East (92.0%), Kavango West (89.2%) and Kunene (85.4%) are found to be more vulnerable to food shortages (Table 10.1) than other regions. //Karas (20.6 %) is the least vulnerable region. It turned out that the agricultural households (mostly from Omusati and Ohangwena) which experienced food shortages during the past 12 months were also those which were worried about not having enough food during the past three months (see Table 10.2).

Table 10.1: Distribution of agricultural households who experienced food shortage during the past 12 months by region

Region	Total Number of Agricultural Households	Number of Households that experienced food Shortage	Percent within regions
//Karas	1 253	258	20.6

10.2. Number of meals taken per day

In the communal areas of Namibia, 52.3 percent of children take three meals a day on average as compared to 15.2 percent adults (Table 10.3 and Figure 10.1). In Omaheke region, around 92 percent of children are recorded to have on average taken three meals a day followed by Erongo region with 87.3 percent. //Karas region recorded the least percentage (27.1%) of children who took three meals a day on average. Where there is insufficient food for all members, adults would rather eat once or twice a day and allowed the children to eat thrice.

Table 10.3: Distribution of Agricultural Households Population by average number of meals taken per day and region

Region	Household Population by Proportion of meals taken per day					
	One meal		Two meals		Three meals	
	Adults	Children	Adults	Children	Adults	Children
//Karas	21.3	12.3	65.1	60.6	13.6	27.1

10.3. Months in which food shortage occurred

The distribution of agricultural households who experienced food shortages in 2013 and 2014 is presented in Table 10.4. The results reveal that generally, more households experienced significant food shortages in January than the subsequent months of the year.

Table 10.4: Distribution of agricultural s who experienced household food shortage in 2013 and 2014

Year	Months	Number of agricultural Households who experienced food shortage
2013	January	23 387
	February	4 313
	March	5 988
	April	4 987
	May	7 810
	June	8 789
	July	6 243
	August	17 964
	September	13 388
	October	12 316

	February	7 549
	March	4 672
	April	2 635
	May	962
	June	179

10.4. Reason for food shortage

The reasons for the shortage of food provided by the agricultural households are presented in Table 10.5 . The first most important reason for food shortage identified by agricultural households was “loss of crops/ or insufficient production” (87 428) followed by Lack of jobs (5 172):

The second most important reason for food shortage identified by households was lack of jobs (19 381), followed by Lack of adequate land and Lack of adequate labour with 13 594 and 11 879 agricultural households respectively.

Furthermore, 11 417 households cited lack of adequate capital , 10 010 households cited lack of jobs and 9 218 households cited lack of adequate labour as the third main reason for food shortage.

Table 10.5: Distribution of agricultural households by main reason for food shortage

Reasons for food shortage	Number of agricultural household		
	First Reason	Second Reason	Third Reason
Loss of crops/Insufficient production	87 428	11 209	3 834
Lack of jobs	5 172	19 381	10 010

Loss of livestock	4 784	11 262	8 960
Others	4 375	7 208	10 240
Don’t Know	3 260	17 822	44 532

10.5. Immediate response to alleviate food shortage

Households were asked to provide information on their immediate responses to alleviating food shortage. The results presented in Table 10.6 show that a total of 268 208 household members obtain assistance from Government’s food relief programme followed by 107 567 persons who used their savings to buy food. A further 48 128 persons alleviated food shortage through Social grants. Only 495 household members used sale of land as main immediate response to alleviate food shortage (Table 10.6 adult males and females as well as in boys and girls disaggregation.

Table 10.6: Distribution of agricultural Household Population who experienced food shortage by type of immediate response taken by sex

Steps taken to alleviate Food Shortage	Total	Agricultural Household Population			
		Adult male	Adult female	boys	Girls
Use saving to buy food	107 567	38 310	44 529	12 374	12 354
Take out a loan	2 451	953	1 028	235	235
Sell land	495	183	184	64	64
Sell livestock	18 388	8 175	6 414	1 931	1 868
Get another job	10 173	4 552	4 349	629	643
Start or expand family business	5 700	1 717	2 915	532	536

Help from charities	7 418	1 855	2 854	1 351	1 358

Note: The adult males and females are from the age of 15 years and above while boys and girls are below 15 years of age.

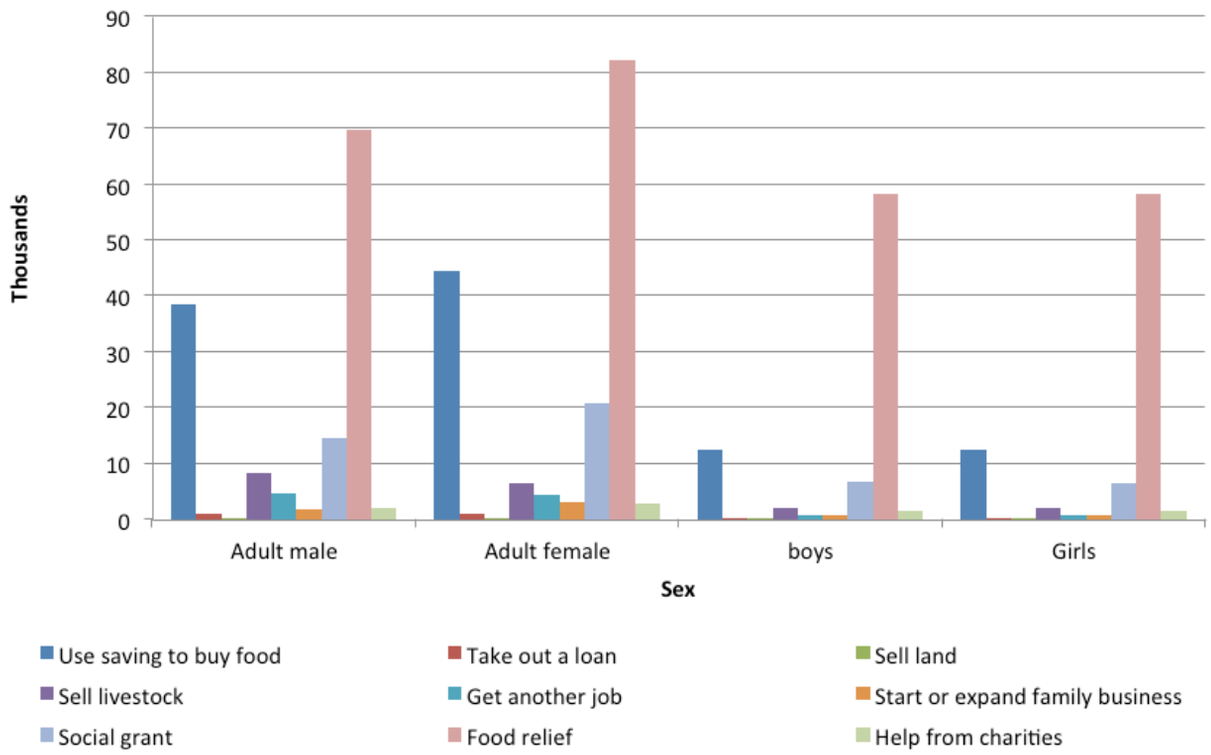

Figure 10. 1: Agricultural Household Population who experienced food shortage by type of immediate response taken by sex

Changes in eating patterns were observed in all groups (adult male and female adult and boys and girls), with most of them (186 412 persons) preferring to skip meals as a way of managing the available food (Table 10.7 and Figure 10.3). In addition, reducing the size of the meal was reported (156 243 persons) as the second preferred change in the eating pattern across the board, while the least preferred option was reported (140 834 persons) as being eating less preferred food.

Table 10.7: Distribution of agricultural household population who have taken steps to manage the available food by sex

Change in eating pattern	Total	Agricultural Household Population			
		Male adult	Female adult	Boys	Girls
Skipping meals	186 412	55 045	61 688	35 275	34 404
Eating less preferred food	140 834	40 084	44 983	27 995	27 772

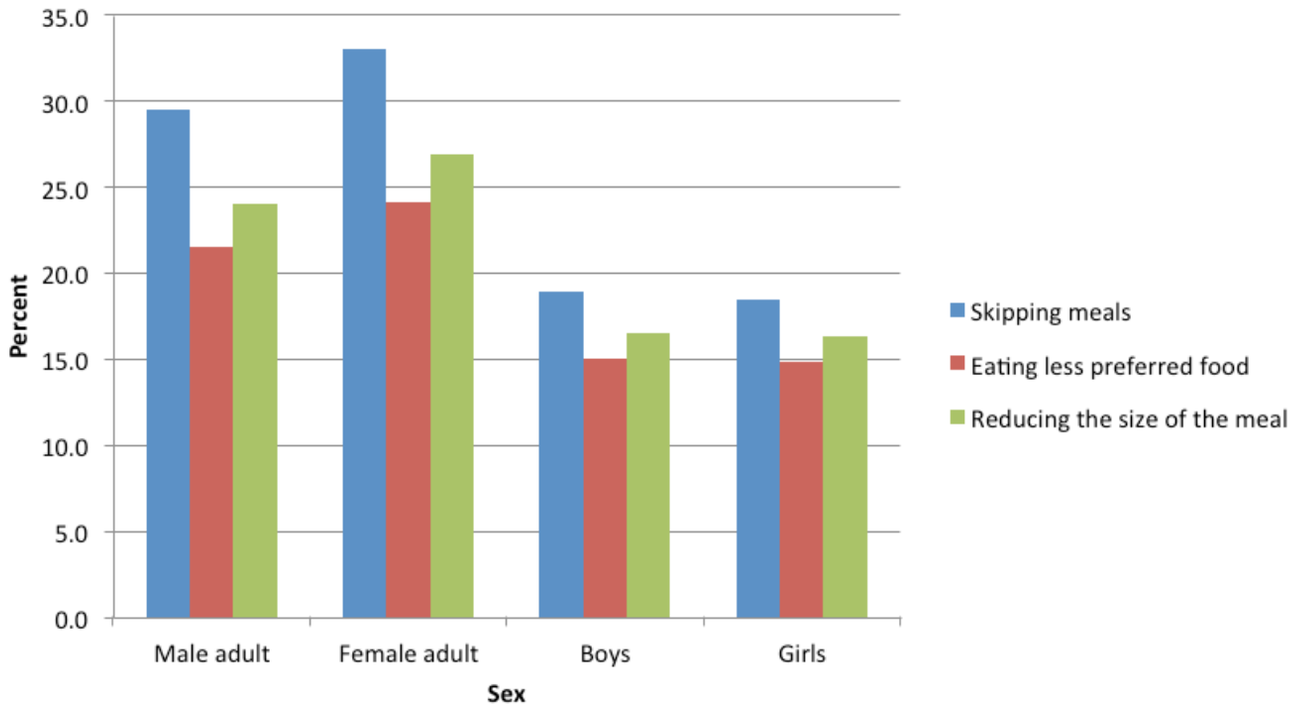

Figure 10. 2: Percent of agricultural household who took steps to alleviate food shortage by kind of steps taken and Sex

A total of 90 316 households reported that they are likely to experience food shortage in the coming twelve months (Table 10.8). The results further show that households in Kunene region (77.8%), Kavango West region (74.3%), Ohangwena region (65.7%)and Kavango East region (64.3%) are most likely to experience food shortages. The least number of agricultural households (6.4 %) likely to experience food shortages in the next 12 months was reported in Khomas region.

Table 10.8: Number of agricultural Households likely to experience food shortages in the next 12 months by region

The number of agricultural households that experienced one form of natural or man-made disasters by the extent of the disaster is presented in Table 10.9. A great number of agricultural households (114 375 out of 294 162) or 39 percent reported that they experienced severe disasters in the past 12 months. The majority of these households (55 267) indicated that they experienced severe drought, while 30 343 households suffered severely from pests/diseases. Floods and tidal waves as well as erratic rains also severely affected 9 132 and 7 709 of agricultural households, respectively. In general, similar patterns were also observed when it came to slight and moderate experiences of the disasters.

Table 10.9: Number of agricultural households that experienced natural disasters in the past 12 months by extent of disaster

11.1. Economic activities other than agriculture

The census asked the agricultural households population to indicate other types of economic activities they are engaged in, and the resulting outcome is presented in Table 11.1 and Figure 11.1. The female population in the agricultural households is in the majority in some of the economic activities such as Agricultural services (51.2%), Manufacturing (56.5%) as well as in Wholesale and retail trade industries (56.1%).

Otherwise, the male population dominated the Hunting, trapping, game propagation; Forestry, logging and related service; Fishing, aquaculture and related service activities, as well as in Hotels and restaurant activities.

Table 11.1: Number of agricultural household population by sex and type of economic activity other than agriculture

Other Economic Activity	Total	Number of Agricultural Population			
		Male	%	Females	%
Agricultural services	31 259	15 265	48.8	15 994	51.2
Hunting, Trapping, Game propagation	2 655	1 622	61.1	1 033	38.9

11.2. Other income sources

Other income sources of the agricultural households' population by the sex are presented in Table 11.2. The results show that the majority of the females derived extra income from economic production (51.9%), external remittances (52.9%) as well as from old age pension grants (55.7).

In contrast, the male population was dominant in deriving extra income from paid employment (59.3%), from investment income (53.0%), pension income (53.8%), internal remittances)(52.7%), veteran social grants (56.2%) and Social grants (53.6%).

Table 11.2: Number of agricultural households with other income source by sex

Income source	Total	Agricultural Household Population reporting Other Income			
		Male	%	Female	%
Income derived from economic production	4 385	2 110	48.1	2 275	51.9

12.1. Agricultural household members by status of employment

The total agricultural households members involved in agricultural activities were 609 211 of which 452 283 were permanent workers while 156 928 were temporary workers (Table 12.1and Figure 12.1). Of the total adult males and females engaged in agricultural work, 71.7 percent of males and 78.9 percent of females were permanently engaged in agricultural activity. The majority of boys and girls in the agricultural households who are engaged in the agricultural work were permanently engaged (69.5 % for boys and 71.4 % for girls).

Table 12.1: Distribution of agricultural household members engaged in agricultural activity by work status and sex*

Work status	Total	Numbers of household members involved in agricultural activity							
		Adult male	%	Adult female	%	Boys	%	Girls	%
Permanent	452 283	143 250	71.7	192 344	78.9	59 283	69.5	57 406	71.4
Temporary	156 928	565 16	28.3	51 318	21.1	26 046	30.5	23 048	28.6
Total	**609 211**	**199 766**	**100.0**	**243 662**	**100.0**	**85 329**	**100.0**	**80 454**	**100.0**

**Note: The adult male and female are from the age of 15 years and above while boys and Girls are below 15 years of age.*

12.2. Paid employees

Table 12.2 presents the distribution of paid employees in the agricultural households by sex and region. The results show that the total number of reported paid employees in the agricultural households was 100 414, which comprises of 51 419 (51.2%) males and 48 995 (48.8%) females. The table also indicates that Kavango East region recorded the highest percentage of paid female employees with 72.1 percent followed by Kavango West region with 51.1 percent.

Table 12.2: Distribution of paid employees by sex and region

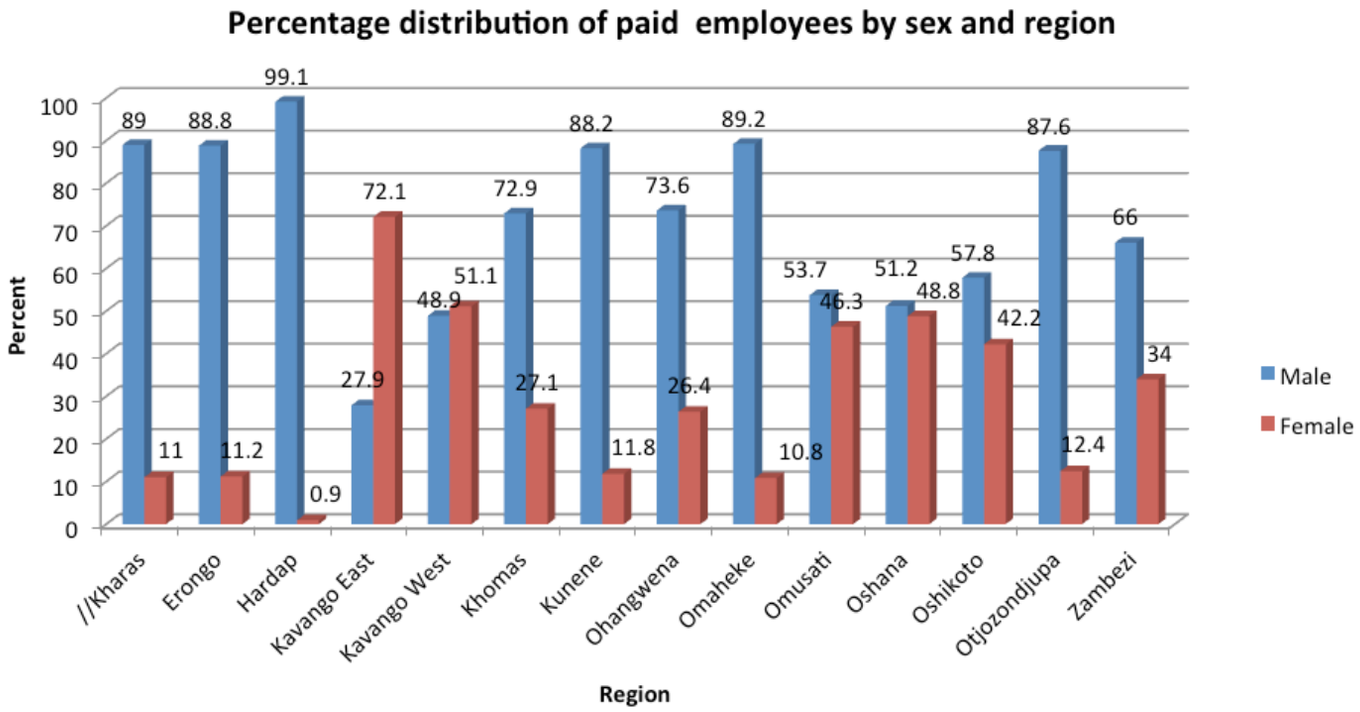

Figure 12. 1: Percentage distribution of paid employees by sex and region

12.3. Hired employees

The hired employees were further asked to indicate their status of employment of which the resulting outcome is presented in Table 12.3. The majority of these employees (69 980) were hired on temporary basis as opposed to 30 734 workers hired on permanent basis. Furthermore, of the hired workers, 57.9 percent of the total adult males and 77.5 percent of total adult females were hired on a temporary basis. Similarly, 83.6 percent of the boys and of the girls were also found to be temporarily hired.

Table 12.3: Distribution of hired employees by work status and sex

Work status	Number of hired employees								
	Total	Adult male	%	Adult female	%	Boys	%	Girls	%
Permanent	30 734	19 060	42.1	9 498	22.5	1 045	16.4	1 131	16.4

Note: The adult males and females are from the age of 15 and above while boys and girls are below 15 of age.

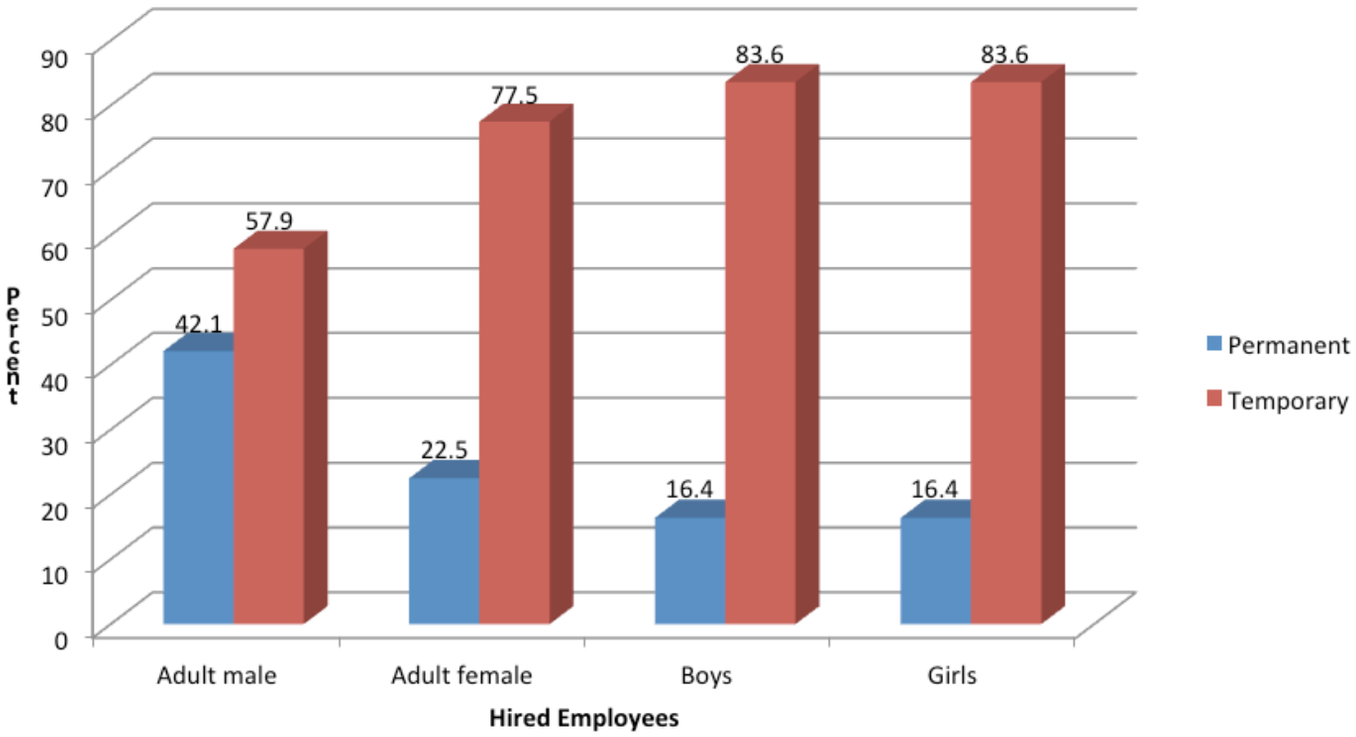

Figure 12. 2: Percentage distribution of hired employees by work status and sex

13.1. Quantity disposed and use of crops

During the census, agricultural households were requested to provide information on the quantity of crops produced and how the crops were used. Table 13.1 shows that millet/mahangu recorded the highest quantity consumed (79 424 tonnes), disposed of as gifts, (55 042 tonnes) or stored (51 696 tonnes). A significant amount of millet/mahangu (24 437 tonnes) was reported to have been lost after harvest.

Similarly, 11 132 tonnes of maize were consumed, 8 196 tonnes were disposed off as gifts, and 1 865 tonnes were used as seeds. The quantity of maize lost after harvest was estimated at 1 931 tonnes. In addition, a further 1 520 tonnes of maize were sold while 1 055 tonnes were processed for sale.

With respect to wheat, 3 154 tonnes were reported as being lost after harvest, while 1 606 tonnes were currently in stock, 1 381 tonnes were consumed and 1 143 tonnes were given away as gifts. The amount of sorghum consumed was 4 512 tonnes of with 3 908 tonnes disposed off as gifts, 2 019 tonnes lost after harvest and1 431 tonnes retained as seeds (Table 13.1).

Table 13.1: Quantity of crop products by type of use/disposition

Crop name	Quantity used for (tonnes)							
	Sale	Consumption	Seed	Processed for sale	Animal feed	Gift	Currently in store	Lost after harvest
Wheat	2	1 381	229	-	3	1 143	1 606	3 154
Maize	1 520	11 132	1 865	1 055	234	8 196	710	1 931
Sorghum	148	4 512	1 431	52	24	3 908	647	2 019
Millet/Mahangu	1342	79 424	12 654	533	1 324	55 042	51 696	24437

Beans	97	3 158	845	3	14	569	225	442

13.2. Quantity of crop production sold

The quantity of crop production sold to different recipients presented in Table 13.2 shows that maize recorded the highest number of production sold (1 520 tonnes). The majority thereof (466 tonnes) was sold to Private Trader in local markets, 404 tonnes was sold to Private trader in Constituencies and 316 tonnes was reported to have been sold to Consumer markets and only 137 tonnes was sold to Government. The total value of all the maize sold to various recipients was estimated to be N$ 3 391 081.

Millet/mahangu was recorded as the second highest crop sold at 1 342 tonnes of which the highest quantity of 744 tonnes was to neighbours/relatives, followed by 189 tonnes to Consumer markets, 125 tonnes to Private traders in local markets and Government bought about 110 tonnes. The total value of the millet/mahangu sold to all the various recipients amounted to N$3 537 706.

Table 13.2: Quantity of crop product sold by type of crop, total value, receiving client.

Crop name	Quantity sold (in tonnes)	Value sold (N$)	Quantity sold to					
			Gov. Org	Private trader local market	Private trader constituency	Consumer at market	Neighbour/ relative	Other
Wheat	2	5 264	-	2	-	-	-	-

13.3. Post-harvest losses

Table 13.3 presents the distribution of the harvest losses of crops encountered by the households and the place of occurrence.

Holders reported to have predominantly suffered greater losses in millet/mahangu which was reported to be about 24 437 tonnes in total. Out of that, a significant quantity of 22 824 tonnes was lost in the field and 464 tonnes lost during storage. The loss of millet/mahangu during the transportation process was reported to be 144 tonnes.

Furthermore, agricultural households reported that a total of 3 154 tonnes of wheat was lost, with 3 143 tonnes lost in the field followed by eight (8) tonnes during storage. Sorghum was the third highest crop with total losses of 2 019 tonnes of which 1 983 tonnes were lost in the field, while maize recorded a total loss of 1 931 tonnes, of which 1 864 tonnes were estimated to be lost in the field (Table 13.3).

Table 13.3: Distribution of crop harvest losses by place of occurrence

Crop Name	Total	Quantity of losses in ton			
		In the field	During storage	During transport	Other

14.1. Livestock ownership

The distribution of agricultural households who reported having livestock by region is presented in Table 14.1 and Figure 14.1. The results show that the total number of agricultural households who own livestock was 62 129 representing about 39.0 percent of the total number of agricultural households.

The results further indicated that though Omusati and Ohangwena regions have the highest number of households (14 354 and 10 927 respectively) with livestock, however, Omaheke region has the highest percentage (90.4%) of agricultural households who own livestock, followed by Otjozondjupa region (69.7%) and Erongo region (54.8%). Kunene and Zambezi regions both reported 53.5 percent and 50.1 percent of the total number of agricultural households owning livestock, respectively.

Table 14.1: Distribution of agricultural households who have livestock by region

Regions	Total no Agricultural HHs	Agricultural HHs who reported livestock	% of HHs reporting livestock
//Kharas	1 253	377	30.1

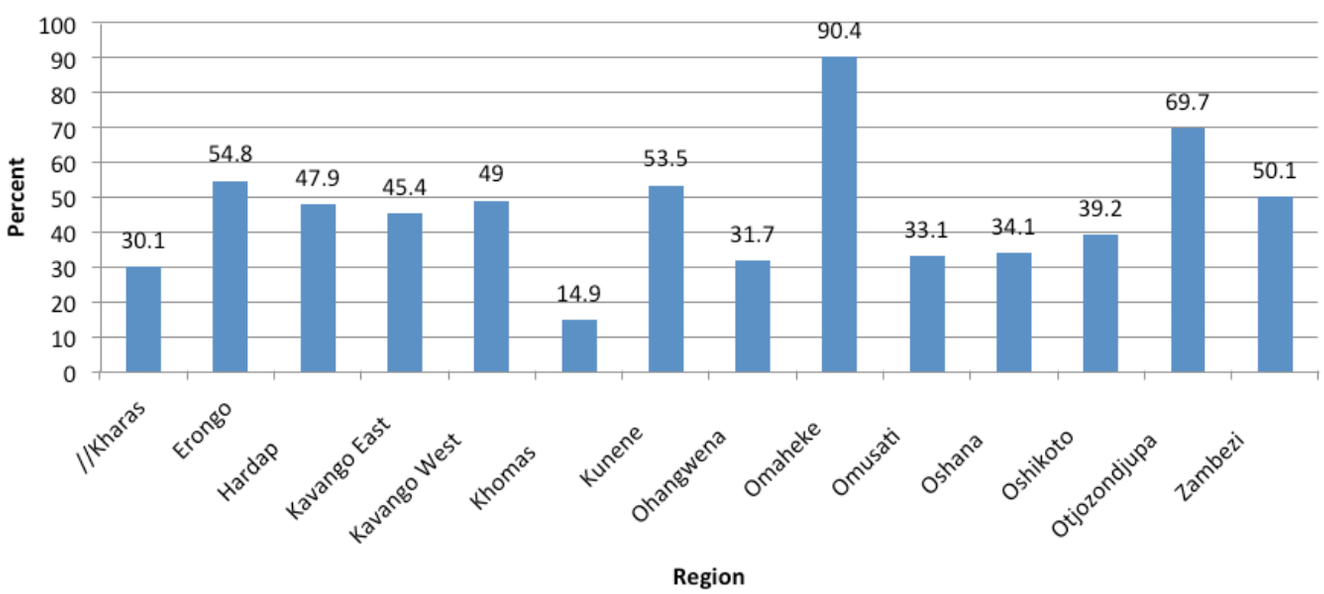

Figure 14. 1: Percentage distribution of agricultural households who have livestock by region

14.2. Cattle by type

The census asked agricultural households to indicate the number and type of cattle they own. The resulting outcome presented in Table 14.2 indicates that there are 872 228 heads of cattle in the communal sector, 682 751 heads of cattle is owned by male household members representing about 78.3 percent of the total number of cattle owned by agricultural households in comparison to the 21.7 percent owned by their female counterparts. This situation, where males own more cattle as compared to the females, is consistent across the type of cattle categories presented in the table.

With respect to the type of cattle owned, the results show that the majority of the cattle owned by households were cows (364 963) of which 84 691 (23.2%) were owned by female household members and 280 272 (79.7%) were owned by male household members. Furthermore, the table indicates Heifers to be the second highest type of cattle owned by agricultural households (121 717) of which the majority (82.1%) were owned by male members of the households. In contrast, the lowest type of cattle recorded to be owned by the households with a total of 72 755 cattle is the Male Calves less than one year.

Table 14. 2: Number and distribution of Cattle by type

Type of Cattle	Total Number of Cattle	Number of Cattle owned by female house hold members	%	Number of Cattle owned by male house hold members	%
Bulls	70,856	13,280	18.7	57,576	83.6
Cows	364,963	84,691	23.2	280,272	79.7
Heifers	121,717	24,924	20.5	96,793	82.1
Female calves less than 1 year	88,921	21,558	24.2	67,363	78.8
Male calves less than 1 year	72,755	13,899	19.1	58,856	83.3
Tollies 1-3 years	77,204	14,982	19.4	62,222	83

Total	**872,228**	**189,477**	**21.7**	**682,751**	**78.3**

14.3. Small stock by type

The distribution of goats and sheep owned by the households by type and sex presented in Table 14.3 shows that a total of 1 618 204 goats were owned by agricultural households. Of these, 580 757 goats were owed by females while 1 037 447 were owned by males. The results further show that the majority (55. 9% and 57.9%) of the goats owned by male and female members of the households were female goats of other types, while the least (4.6% and 4%) respectively were of male Boerbok type (Figure 14.2). The total sheep own by the agricultural households were 163 905 of which the male household members owned 138 488 sheep and female members owns 25 417 sheep. The results (Figure 14.3) further indicate that the majority of sheep that are owned by the female and male members were female sheep (76.5% and 79.9%, respectively).

Table 14.3: Number and distribution of Goats and Sheep by type and sex

Goats and Sheep	Number of Goats and Sheep	Number of Goats and Sheep owned by female households members	%	Number of Goats and Sheep owned by male households members	%
Boerbok (Female)	261 819	89 282	15.4	172 537	16.6

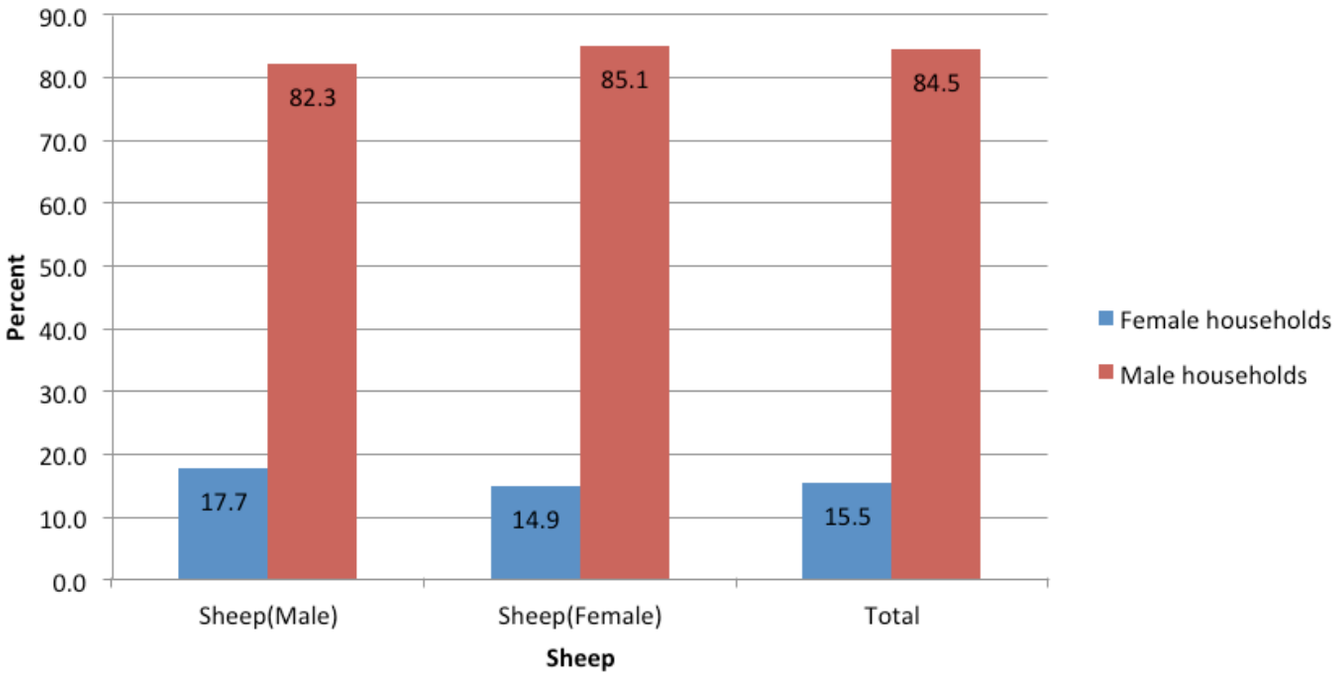

Figure 14. 3: Percentage of sheep owned by households by type and sex

14.4. Domestic animals by type

Information on other domestic animals was collected and the results are presented in Table 14.4. The table indicates that the majority of households own dogs (162 407), followed by donkey/mules (160 880) and pigs (87 206). The female members of the households owned more pigs (78.9%) and cats (54.6%) than the male members, while the male members were horses (87.7%), dogs (72.1%) and donkey/mules (70.1%).

Table 14.4: Number and distribution of other domestic animals by type and sex

Domestic animals	Number of domestic animals	Number of domestic animals owned by female households members	%	Number of domestic animals owned by Male households members	%

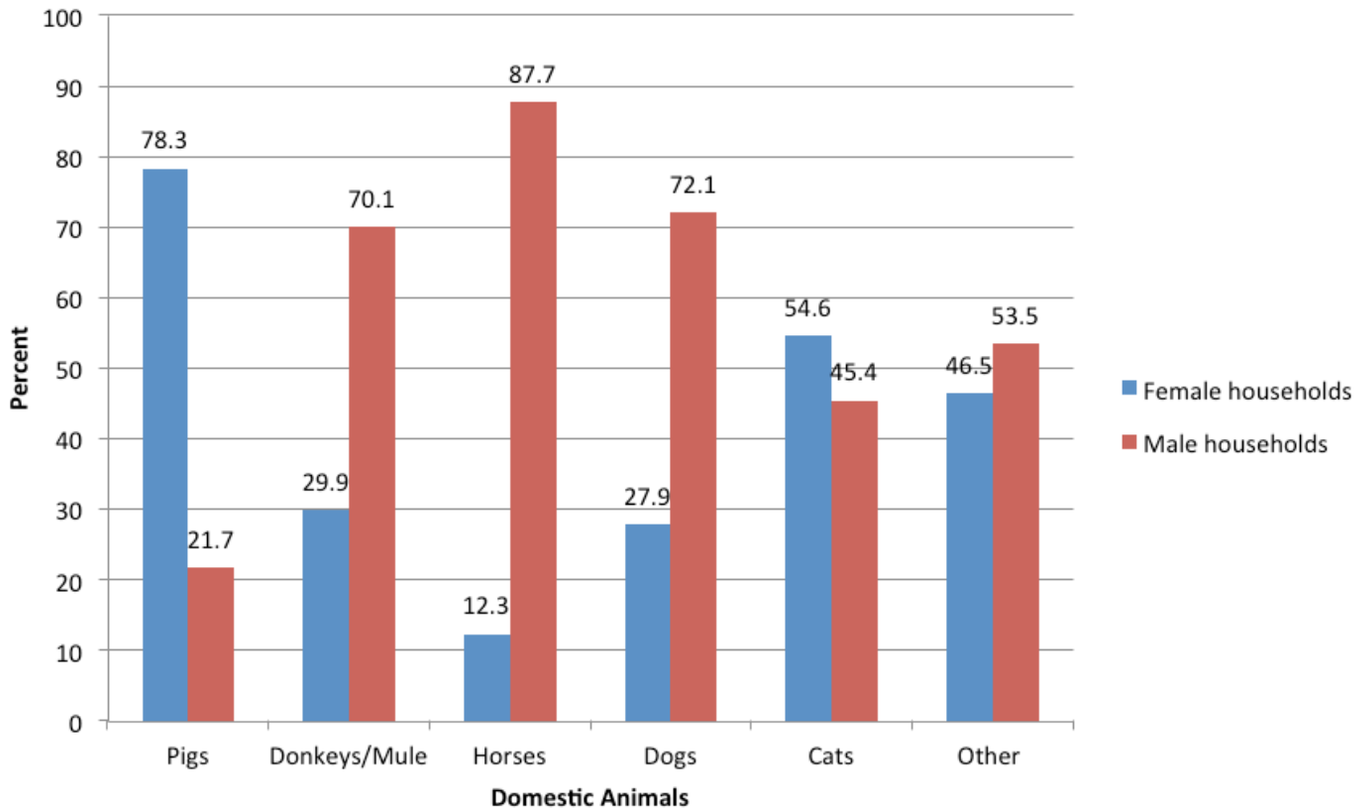

Figure 14. 4: Percentage distribution of other domestic animals by type and sex

14.5. **Poultry by type**

The distribution of poultry owned by poultry type and sex of the household members presented in Table 14.5 shows that total numbers of poultry owned were 1 511 825 of which 1 038 212 (68.7%) were owned by female household members and 473 677 (31.3%) were owned by male households members. The results further indicate that the female members of the households owned more indigenous chicken (69.8%), exotic chicken (broilers) (67.7%) and exotic chicken (layers) (65.3%) than the male members, whereas the male members owned more geese (67.6%), pigeons (59.5%) guinea fowl (57.2%) than the female members.

Table 14.5: Numbers and distribution of poultry by type and sex

Type of Poultry	Number of Poultry	Number of Poultry owned by female households members	%	Number of Poultry owned by male households members	%
Indigenous Chicken	1 334 163	931 753	69.8	402 410	30.2
Exotic Chicken(layers)	81 717	53 346	65.3	28 371	34.7
Exotic Chicken(broilers)	28 657	19 412	67.7	9 245	32.3
Duck	34 220	19 950	58.3	14 270	41.7
Geese	4 923	1 596	32.4	3 327	67.6
Guinea Fowl	3 374	1 444	42.8	1 930	57.2
Pigeons	17 369	7 031	40.5	10 338	59.5
Other	7 466	3 680	49.3	3 786	50.7
Total	**1 511 825**	**1 038 212**	**68.7**	**473 677**	**31.3**

14.6. Livestock intake

Table 14.6 shows a distribution of Livestock intake by type of animal during the past 12 months. Generally across all livestock most of the intake were attributed to by birth.

However, the majority of the purchased and acquired livestock were cattle (44.6%) followed by pigs (36.6%) and sheep (21.6%) while the least purchased and acquired livestock were poultry accounting only for 9.8 percent.

Table 14.6: Number and distribution of Births, Purchases and Acquired Animals by type during the past 12 months

Type of live stock	Total livestock intake	Number of births	%	Number of purchases and acquired	%
Cattle	103 463	57 281	55.4	46 182	44.6
Goats	474 049	409 076	86.3	64 973	13.7
Pigs	80 377	50 982	63.4	29 395	36.6
Poultry	868 883	783 515	90.2	85 368	9.8
Sheep	51 770	40 573	78.4	11 197	21.6

14.7. Livestock Off-take

In addition to the livestock in-take, the total number of livestock off-take were also recorded and the resulting outcome presented in Table 14.7 which shows a livestock off – take was mainly through consumption except for Pigs and sheep that showed a high percentages (47.7% and 46.5% respectively).

Table 14.7: Number and distribution of livestock consumed, sold and given away by type during the past 12 months

Type of Livestock	Total livestock off- take	Number consumed	%	Number sold	%	Given away/ gifts	%
Cattle	74 521	42 618	57.2	22 869	30.7	9 034	12.1
Goats	240 325	137 279	57.1	80 703	33.6	22 343	9.3
Pigs	45 010	20 836	46.3	21 206	47.1	2 968	6.6
Poultry	732 627	557 293	76.1	96 516	13.2	78 818	10.8
Sheep	26 717	11 386	42.6	12 413	46.5	2 918	10.9

14.8. Livestock Losses

The distribution of livestock lost by type and reasons for loss during the past 12 months is presented in Table 14.8. The results indicate that livestock lost, the majority died due to diseases, followed by those that died due to starvation. Moreover, the livestock were lost to predators while some were lost to theft or just lost. Livestock which died as a result of diseases, the highest percentage were pigs (55.6%) followed by poultry (40.8%). Of those that died because of starvation, the highest percentage were cattle (62.3%) followed by sheep and goats accounting for 34.9 and 34.1 percent, respectively. Poultry were lost mainly to predators (47.2%) while pigs (15.4%) and sheep (15.0%) were lost mainly to theft.

Table 14.8: Number and distribution of livestock lost by type of livestock, reason for loss during the past 12 months

Type of livestock	Total Livestock losses	Death due to disease	%	Stolen or lost	%	Lost to predators	%	Death due to starvation	%
Cattle	542 174	119 311	22.0	63 570	11.7	21 542	4.0	337 751	62.3
Goats	708 231	264 393	37.3	104 017	14.7	98 658	13.9	241 163	34.1
Pigs	19 716	10 964	55.6	3 034	15.4	2 058	10.4	3 660	18.6
Poultry	921 061	376 177	40.8	73 959	8.0	435 172	47.2	35 753	3.9
Sheep	87 163	25 871	29.7	13 099	15.0	17 792	20.4	30 401	34.9

14.9. Feeding practice used

The distribution of households by feeding practice used for each type of livestock during the past 12 months is presented in Table 14.9. It is evident from the table that the majority of livestock receiving feeds were goats (197 017), followed by poultry (186 681) and cattle (183 117). The table further indicates that more pigs (56 430) received feeds as compared to sheep (41 655).

The census further revealed that the majority of the livestock; goats (53 567), poultry (46 667), cattle (45 299) and sheep (7 586); were fed only by grazing/free ranging with some feed, while 18 908 pigs were fed with feeds only (no grazing or scavenging). Furthermore, grazing/free ranging with some feeding was the second prominent feeding method in goats (39 129), cattle (31 480) and sheep (7 483) while feeding on crop residues was prominent with poultry (36 546) and feeding with some grazing/free ranging was the second prominent method with pigs (9 413).

Table 14.9: Number and distribution of households by feeding practice used, type of livestock during the past 12 months

Feeding practice	Type of Livestock				
	Cattle	Goats	Sheep	Pigs	Poultry
Baled grass	6 518	5 787	1 876	n/a	n/a
Camel thorn pods	7 350	8 145	2 316	591	n/a
Commercial feed meals	4 249	3 259	1 632	1 664	3 775
Crop residue(e.g. maize/millet)	23 514	28 669	3 228	7 966	36 546
Lucerne	9 243	5 758	2 722	504	1 000
Mainly feeding with some grazing/Free ranging	14 106	17 189	2 890	9 413	30 190
Mainly grazing/Free ranging with some feeding	31 480	39 129	7 483	6 325	31 749
Only feeding(no grazing or scavenging)	2 668	3 147	819	18 908	29 539
Only grazing/free ranging with some feed	45 299	53 567	7 586	8 624	46 667
Other	3 437	4 420	819	1 880	7 215
Protein Lick	7 729	7 034	3 307	n/a	n/a
Salt lick	23 337	17 727	5 062	n/a	n/a
Summer Phosphate Supplementation	4 187	3 186	1 915	555	n/a
Total	**183 117**	**197 017**	**41 655**	**56 430**	**186 681**

14.10. Pasture management system used

The distribution of the households by the type of main pasture management system used and by region during the past 12 months is presented in Table14.10. The results reveal that continuous grazing as the main pasture management system was reported in almost all the regions except in Khomas and Zambezi regions where the main pasture management system was rotational grazing on available land. Furthermore, Omusati region reported the highest number (51 136) of households practising the three types of pasture management systems, of which the highest number (38 552 households) practised continuous grazing as the primary pasture management system with 6 353 households using rotational grazing based on available grazing land and a further 6 231 households practising rotational grazing based on available water points.

Ohangwena region has the second highest number of households (44 015) using the three pasture management systems with the majority, about 32 297 households, reporting the use of continuous grazing as a primary pasture management system.

Table 14. 10 : Number and distribution of households by type of main pasture management system used and region during the last 12 months

Regions	Rotational grazing based on available grazing land	Rotational grazing based on available water points	Continuous grazing	Total
Karas	420	581	1 161	2 162
Erongo	671	417	1 301	2 389
Hardap	17	11	418	446
Kavango East	1 457	2 829	8 407	12 693
Kavango West	428	2 581	10 392	13 401
Khomas	84	12	50	146
Kunene	1 808	1 324	3 787	6 919

Oshikoto	4 209	3 399	18 660	26 268
Otjozondjupa	1 455	476	4 355	6 286
Zambezi	4 425	3 259	2 949	10 633
Namibia	**28 660**	**32 173**	**133 534**	**194 367**

The census requested the households to provide information on the type of improved practice used by the households for their livestock. The results presented in Table 14.11 indicates that 86 801 households employ different types of improved practices, of which 71 697 households use veterinary drugs, 8 242 use commercially prepared animal feed while 6 862 make use of insemination practises.

The regional breakdown of the households who make use of veterinary drugs indicates that the majority were from Omusati region (19.5%) followed by Ohangwena region (18.8%) and Oshikoto region (14.7%). Furthermore, households who have indicated using commercially prepared animal feed were mostly from the regions of Omusati (17.0%), Omaheke (15.3%), Otjozondjupa (13.9%), Oshikoto (13.4%) and Ohangwena (12.8%). Finally, insemination is also practised in the regions of Ohangwena (20.9%), Omusati (18.8%) as well as Oshikoto (17.4%).

Table 14.11: Number and distribution of households by type of improved practice for their livestock and region

Region	Total	Type of improved practice					
		Commercially prepared animal feeds	%	Veterinary drugs	%	Insemination	%

APPENDIX

A: GLOSSARY OF CENSUS TERMS

Agricultural holding: An agricultural holding is an economic unit of agricultural production under single management comprising all livestock kept and all land used wholly or partly for agricultural production purposes, without regard to title, legal form, or size.

Agricultural holder: The agricultural holder is defined as the civil or juridical person who makes the major decisions regarding resource use and exercises management control over the agricultural holding operation.

Area of holding according to land use types: Land use refers to activities – such as growing crops, raising livestock or cultivating fish – carried out on the land making up the holding with the intention of obtaining products and/or benefits.

Agricultural census reference period: The reference period for agricultural census items varies according to the type of data. The reference periods are usually the day of enumeration (for inventory items) or a twelve-month reference period (for continuing activities).

Agricultural Extension Services: refers to the provision of agricultural advice and information.

Locality: A locality is any place with one or more dwellings, either a compact settlement or to crop and livestock producers etc. Extension services may be provided by Government scattered houses.

Agricultural Equipment: refers to machinery, implements and other facilities used on a farm to help with farming.]

Area harvested: Area harvested refers to the total area from which the crop is gathered.

Arable land: Arable land is land that is used in most years for growing temporary crops. It includes land used for growing temporary crops in a twelve month reference period, as well as land that would normally be so used but is lying fallow or has not been sown due to unforeseen circumstances.

Agricultural land: Agricultural land is the total of cropland and permanent meadows and pastures.

Agricultural Season: The main/first agricultural season normally refers to the growing cycle of temporary crops that are planted and harvested in the first half of the year, occasionally extending up to the end of June.

Agro-forestry: farm management system involving growing trees in conjunction with crops and livestock production.

Aquaculture: farming of aquatic organisms including fish, crustaceans, mollusks, and aquatic plants.

Apiary: is the maintenance of honey bee colonies, commonly in hives, by humans.

Collateral is defined as assets pledged as security for a loan of money, which means that if the borrower defaults on the terms of the loan, the collateral may be sold and the proceeds used to pay off the loan. For the purpose of the agricultural census, collateral is used in a wider sense to also cover guarantee provided for the purchase of goods and services.

Cropland: Cropland is the total of arable land and land under permanent crops.

Drainage: removal of excess water to improve agricultural productivity.

Drip irrigation: A drip irrigation system delivers water directly to the root zone of a plant, where it seeps slowly into the soil one drop at a time. Almost no water is lost through surface runoff or evaporation, and soil particles have plenty of opportunity to absorb and hold water for plants

Economic activity status: a classification describing a person as employed, unemployed or not economically active.

Economic Production Activities: Other economic production activities undertaken by the household enterprise, other than agricultural production on the holding.

Educational attainment: highest level of education achieved by a person.

Employed: a person with paid work or in self-employment.

Employee: a person in paid employment.

Enumeration area (EA): small geographic unit defined for census enumeration purposes.

Enterprise: an economic unit under single management consisting of one or more than one establishment.

Exotic: Refers to livestock introduced in the country from abroad.

Extension workers: These are individuals employed by the government or non-governmental organizations who work as agricultural development agents for contacting and demonstrating improved farming methods to farmers.

Extension Services: refers to personal contact with extension personnel or direct participation in extension activities such as a farm demonstration.

Environmental conservation: refers to practice of protecting the environment, on individual, organizational or governmental level, for the benefit of the natural environment.

Freehold farms: The permanent ownership of land or buildings which can be legally passed on to heirs

Fertilizers: substances that supply plants with nutrients or enhance plant growth, containing at least 5% of the three primary nutrients. (N P & K)

Forest: land with trees of height 5 meters or more with crown cover of more than 10%.

Frame: the basis used for identifying all the statistical units to be enumerated in a statistical collection.

Field: A field is a piece of land in a parcel separated from the rest of the parcel by easily recognizable demarcation lines, such as parts, cadastral boundaries and/or hedges. A field may consist of one or more plots, where a plot is a part or whole of a field on which a specific crop or crop mixture is cultivated.

Farm management practices: refers to the different activities practiced on the farm, such as use of irrigation, application of fertilizers, use of improved seed, use of pesticides, etc.

Feeder road: is a minor or small road used to bring the traffic to a major road.

Granary: is a special storage house/receptacle which has been constructed in such a way that pests e.g. rodents will not easily access the granary.

Household: A household consists of one or more persons related or unrelated who live together in one or part of one or more than one housing unit/dwelling unit and have common catering arrangements.

Household food security: the situation where all members of a household at all times are consuming enough safe and nutritious food.

Head of household: The Head of the household is a person of either sex who is a member of the household and generally runs the affairs of the household and is looked upon by the other members of the household as the main decision maker.

Hired labour: Is labour input supplied by other persons other than the holding members and who are paid for their work either in cash or kind or both. The persons are hired for doing agricultural work on the holding; they can be permanent or temporary.

Irrigation: Irrigation refers to purposely providing land with water, other than rain, for improving pastures or crop production.

Improved/cross: refers to livestock which are crosses of exotic and indigenous breed.

Indigenous cattle: refers to livestock of local types e.g. the long horned cattle.

Joint holder: is a person making the major decisions regarding resource use and exercising management control over the agricultural holding operations, in conjunction with another person.

Legal status: Legal status refers to the juridical aspects under which the agricultural holding is operated. It also refers to other aspects about the type of holding. From the juridical point of view, a holding may be operated by a single individual, jointly by several individuals with or without contractual agreement belonging to the same or to different households.

Land tenure: Land tenure refers to the current status of the land operated by the holding. The collection of data should relate specifically to that land. Land rented out to others should be excluded. The reference period for land tenure data is usually the day of enumeration.

Land temporarily fallow: Land temporarily fallow is arable land at prolonged rest before re-cultivation. This may be part of the holding's crop rotation system or because the normal crop cannot be planted because of flood damage, lack of water, unavailability of inputs, or other reasons.

Land under temporary crops: Land under temporary crops includes all land used for crops with a less than one year growing cycle; that is, they must be newly sown or planted for further production after the harvest.

Land under permanent crops: Land under permanent crops refers to: land cultivated with long-term crops which do not have to be replanted for several years; land under trees and shrubs producing flowers, such as roses and jasmine; and nurseries (except those for forest trees, which should be classified under "forest or other wooded land"). Permanent meadows and pastures are excluded from land under permanent crops.

Land under temporary pastures: is the land temporarily cultivated with pastures.

Land under permanent pastures: means land used permanently (i.e. for five years or more), seeded and cared for or grown naturally (grazing land). Permanent pastures on which trees and shrubs are grown should be classified under this category only if the growing of grass (naturally growing grass) is the most important use of the area.

Land use: classification of land according to the activity undertaken on the land.

Legal status of holder: juridical aspects under which an agricultural holding is operated.

Livestock: animals (including birds and insects) kept or reared in captivity mainly for agricultural purposes.

Loan/Credit: Loan for agricultural purposes refers to any type of credit received for purposes related to the operations of the agricultural holding.

Local produce market: refers to farmers who buy produce at your local farmer market. Farmer's markets feature local farmers who sell their products once or twice a week at stands located in public use areas.

Miller: refers to a person who operates a mill, a machine to grind a cereal crop to make floor.

Mixed or Associated Cropping: Mixed cropping, also called associated and inter-planted cropping, refers to the situation when two or more different temporary or permanent crops are grown simultaneously on the same field or plot.

Mixed stand: This describes different crops simultaneously grown on the same plot.

Module: a separate component of the agricultural census – a modular approach is used for the agricultural census, with core and supplementary modules.

Nurseries refer: to a place where young plants are grown and cared for.

Number of years since cleared (for each parcel): The purpose of this item is to better understand the extent of recent land clearances, especially where shifting cultivation is present or where deforestation is a concern. Usually, it will only be necessary to collect data in broad ranges, such as: in the last one year; 1–3 years ago; 4 or more years ago.

Organic fertilizers: fertilizers prepared from processed plant and animal materials

Own-account agricultural production: a household characteristic, indicating that the household contains one or more agricultural holdings.

Other wooded land: land with trees/shrub/bush cover less than that required to be classified as a forest.

Parcel: A parcel is any piece of land, of one land tenure type, entirely surrounded by other land, water, road, forest or other features not forming part of the holding or forming part of the holding under a different land tenure type.

Pesticide: substances intended to repel, mitigate, control or destroy diseases and pests in plants or animals and to prevent any harm to agricultural commodity during production, storage, transport, processing and marketing etc.

Permanent crops: Permanent crops are crops with a more than one year growing cycle. Permanent crops may be grown in a compact plantation or as scattered trees/plants and both should be included.

Plot: A plot is defined as a piece of land within the holding on which a specific crop or a crop mixture is grown. A parcel may be made up of one or more plots.

Pure stand: This is a crop cultivated in a crop plot. A pure stand can either be permanent or temporary.

Primary Sampling Unit (PSU): Is the smallest Geographical area defined for the purpose of data collection. PSUs were created using the Enumeration areas of the 2011 Population and Housing Census.

Period of loan or credit refers to the period over which the loan or credit is to be paid off, as agreed at the time the loan was received.

Range land Management: is the carefully use of land management of rangeland resources (plants, animals, soil and water) to meet the needs and desires of society.

Respondent: The respondent is the person from whom data are collected about the agricultural unit. Random sampling: sampling method used for sample surveys, in which each unit within the scope of the survey has a fixed, but not necessarily the same, probability of selection in the sample.

Reference period: the time period to which a given data item collected in a census or survey refers – for example, an agricultural year for crops; the day of enumeration for livestock.

Soil degradation: Soil degradation is the decline in soil quality caused by natural processes or, more commonly, improper use by humans. Its consequences include: loss of organic matter; decline in soil fertility; decline in structural condition; erosion; adverse changes in salinity, acidity or alkalinity; and the effects of toxic chemicals, pollutants or excessive flooding.

Soil erosion: Soil erosion is the displacement of soil material by running water, rainfall, wind or other factors, resulting in a decline of arable layers

Sub-holding: A sub-holding is defined as a single agricultural activity or group of activities managed by a particular person or group of persons in the holder's household on behalf of the agricultural holder.

Sub-holder: A sub-holder is a person responsible for managing a sub-holding on the holder's behalf.

Sampling frame: the means by which all in-scope units are identified for a sample survey.

Sampling error: the error in statistics obtained from a sample survey because data are collected from only a sample of unit

Sector: the institutional category (such as household, corporation, cooperative, government) to which the holding belongs.

Soil degradation: decline in soil quality caused by natural processes or improper use by humans.

Source of Loan refers to who provided the credit.

Specific house/room; refers to a house or room used purely/solely for storage of agricultural produce.

Scope: the geographical area or types of units covered by a statistical collection

Temporary crops: crops with a less than one-year growing cycle.

Total area of holding: Total area of holding is the area of all the land making up the agricultural holding. It includes all land operated by the holding without regard to title or legal form. Thus, land owned by members of a household but rented to others should not be included in the area of the holding.

Under shelter/outside; meaning that there are some shelters for storage, but not a house with complete walls.

Unemployment: a situation where a person of working age is without work, but is available for work and seeking work.

Wood or Forest land: includes wood lots or tracts of timber, natural or planted, which have or will have value as wood, timber or other forest products

Whenever "–"i.e. dash appears, it indicates that data is insignificant to publish.

E: ESTIMATION PROCEDURE

Population figures were estimated based on the sample data using a weighting procedure as explained below.

Variables collected during phase 1

Since the sample is selected in 2 stages there will be 2 probabilities of selection, P_1 for the first stage and P_2 for the second stage. First stage probability is based on the PPS selection procedure and the second stage probability is based on the random sampling procedure.

First stage probability of selection P_1 is given by

$$P_1 = \frac{M_{hi} n_h}{M_h}$$

Where;

M_{hi} = Number of Agricultural households in PSU i in stratum h (PSU size as derived from the 2011 Population and Housing Census)

M_h = Number of agricultural households in the stratum h (stratum size)

n_h = Number of PSUs selected from the stratum h

Second stage probability of selection P_2 is given by

$$P_2 = \frac{m_{hi}}{M'_{hi}}$$

Where;

M'_{hi} = Number of agricultural households in PSU i in stratum h according to survey listing

m_{hi} = Number of agricultural households in the sample from PSU i in stratum h

Therefore the inclusion probability of a holding, $p = p_1 * p_2$

Base weight

Since the PPS selection is and unequal probability selection the sample data has to be weighted. These weights which are generally called sample weights or base weights are the inverse of the inclusion probability.

Therefore the base weight W is given by

$$W_{hi} = \frac{1}{p} = \frac{1}{p_1} * \frac{1}{p_2} = \frac{M_h}{M_{hi} n_h} * \frac{M'_{hi}}{m_{hi}}$$

Although the expected sample agricultural households was m_{hi} the responding households would be less than this number. Since the non-response was not too large and the reasons seem to suggest that there are no remarkable differences between the responding and non responding households, the responding households (r_{hi}) were taken as a random sample of the selected households. This will affect the probabilities and accordingly the weight and therefore the non response adjusted weight is

$$w'_{hi} = \frac{M_h}{M_{hi} * n_h} * \frac{M'_{hi}}{r_{hi}}$$

Estimation of a total

A total $\hat{Y}$ could be estimated from the sample by the following estimator;

$$\hat{Y} = \sum_{h=1}^{L} \sum_{i=1}^{n_h} \sum_{j=1}^{m_{hi}} W_{hi} y_{hij}$$

Where;

y_{hij} = value of any characteristic of the j^{th} household in i^{th} PSU of stratum h

L = Number of strata

Estimation of a ratio

A ratio is estimated by;

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

Where $\hat{X}$ is estimated in the same way as $\hat{Y}$.

An ***average*** is in effect a ratio of two estimates, an estimate of the total $\hat{Y}$ and an estimate of the total number of units (agricultural households, individuals etc). An average can thus be estimated in the same way as a ratio, where the variable X takes the value = 1 for all units.

F: SAMPLING ERRORS AND RELIABILITY OF ESTIMATES

Sampling errors

Sampling errors have been calculated for 15 selected indicators. The sampling errors are based on the variances of the estimated figures which in turn depend on the sample sizes and the variation observed in the population units.

Measure of reliability of estimates

The statistical measure used in these computations is the CV (Coefficient of Variation). This is a relative measure which is used to indicate the precision levels of the estimated figures, especially the means and the totals.

The CVs can be classified into 4 broad groups. These groups can then be taken as the general guideline for the acceptable levels of precision.

Group No	CV %	Indicator
1	1% - < 5%	Highly precise
2	5% - < 10%	Good precision
3	10% - < 15%	Acceptable
4	15% - < 20%	Less precise
5	20% or more	Very low precision

Sampling errors for selected indicators

INDICATOR	Estimate	Standard Error	95% Confidence Interval		Coefficient of Variation	Design Effect	Square Root Design Effect	Un-weighted Count
			Lower	Upper
