AGRICULTURAL SURVEY
1990

VOORWOORD

Dit is belangrik dat statistieke van die landbou elke jaar bekom word, maar 'n jaarlikse volledige opname of sogenaamde sensus plaas 'n groot las op die respondente, terwyl die verwerking en vrystelling van die gegewens geweldig baie tyd in beslag neem. Gevolglik is besluit dat daar elke vyfde jaar 'n volledige landbousensus opgeneem sal word (die jongste sensus is in 1988 geneem), terwyl daar in die jare tussenin (sedert 1985) van slegs 10% van die boere verlang sal word om 'n verkorte vraelys in te vul. 'n Opname is egter nie vir 1989 onderneem nie.

Hierdie verslag bevat die resultate van die steekproefopname oor die landbou wat ten opsigte van 1990 onderneem is. Die inligting wat verkry is, is verhef om die gegewens vir die totale landbou volgens ontwikkeling- en statistiese streke te toon.

Die swak samewerking deur die respondente ten opsigte van die landbou-opname, 1990, het daartoe gelei dat die invordering van opgawes hoegenaamd nie op die beplande datum afgesluit kon word nie. 'n Voldoende getal opgawes om op statistiese streeksvlak betroubare resultate daar te stel kon trouens nie in alle gevalle verkry word nie. Van die 6 231 respondente betrek by die steekproefopname het 745 nie gereageer nie. Hierdie nie-reagerende groep het veral in bepaalde gebiede 'n wesenlike invloed gehad.

Alhoewel die Sentrale Statistiekdiens na aanleiding van die relatief groot gedeelte van die opgawes wat nie ontvang is nie, nie in alle opsigte tevrede is met die resultate nie, word dit tog op aandrang van die gebruikers vrygestel om 'n aanduiding van die omvang van die landbousektor beskikbaar te maak. Die resultate moet derhalwe met omsigtigheid gebruik word.

'n Lys van verslae wat ten opsigte van landbousensusse/-opnames vanaf 1976 gepubliseer is, verskyn na die "Verduidelikende Opmerkings".

PREFACE

It is important that agricultural statistics should be obtained on an annual basis, but a complete annual survey or so-called census places a heavy burden on the respondents, while the processing and releasing of the statistics are extremely time-consuming. It has accordingly been decided that a complete agricultural census will be taken every fifth year (the latest census was taken in 1988), while in the intervening years only 10% of the farmers (since 1985) will be required to complete an abbreviated questionnaire. A survey was, however, not undertaken for 1989.

This report contains the results of the sample survey on agriculture undertaken in respect of 1990. The particulars obtained, were raised to reflect information for agriculture as a whole by development and statistical regions.

Because of the poor co-operation of respondents in respect of the agricultural survey, 1990, the collection of returns could not be concluded on the date planned. In fact a sufficient number of returns were not received in order to provide reliable results on statistical region level in all cases. Of the 6 231 respondents involved in the sample survey 745 did not respond. These non-respondents had a substantial effect in certain areas.

Although the Central Statistical Service is not in all respects satisfied with the results because of the relatively large portion of the returns that were not received, they are nevertheless released on the insistance of the users in order to provide an indication of the scope of the agricultural sector. The information should, therefore, be used with caution.

A list of reports which have been published in respect of agricultural censuses/surveys as from 1976, appears after the "Explanatory Notes".

VERDUIDELIKENDE OPMERKINGS

1 OMVANG VAN DIE LANDBOU-OPNAME

1.1 Vir doeleindes van die landbou-opname is boerdery beskou as -

- die kweek van landbougewasse, vrugte, druiwe, neute, saad, bolle, groente of blomme;
- kwekerye, uitgesonderd dié wat hoofsaaklik op aankope en herverkope toegespits is;
- die bedryf van tee-, koffie-, suiker-, hout-, of ander plantasies;
- die teel van vee, wild, pluimvee, pelsdiere en ander diere en varswatervis; en
- die produksie van melk, wol, pelse, eiers of heuning,

vir kommersiële doeleindes.

1.2 Gegewens van landbouhoewes in stedelike gebiede, dit is gebiede met een of ander vorm van plaaslike bestuur, is slegs in daardie gevalle waar die produkte vir verkoop bedoel is, soos kwekerye, groentetuine, blomplase en melkerye ingesluit in hierdie verslag.

1.3 Die gegewens het betrekking op boere in die Republiek van Suid-Afrika wat hul eie of gehuurde plase bewerk het of grond om 'n deel bewerk het. Gegewens ten opsigte van boere en boerderyeenhede in die selfregerende gebiede is uitgesluit.

2 OMSKRYWINGS EN BEGRIPPE WAT GEBRUIK WORD

2.1 Opnamejaar - Besonderhede met betrekking tot die oppervlakte van die boerderyeenheid, die getal werkende eienaars/huurders en gesinslede en die getal besoldigde plaaswerkers is gevra soos op 28 Februarie 1990, terwyl boerderyskuld betrekking het op 31 Desember 1989. Werknemersvergoeding, bruto boerdery-inkomste en -uitgawes, toerusting aangekoop en die besteding aan die oprigting van geboue en ontwikkelingswerk onderneem, het betrekking op die finansiële jaar wat op enige datum tussen 1 Maart 1989 en 28 Februarie 1990 geëindig het, terwyl die markwaarde van boerderybates gevra is soos aan die einde van die finansiële jaar.

2.2 Boerderyeenheid - 'n Boerderyeenheid bestaan uit een of meer afsonderlike plase, hoewes of stukke grond ongeag of hulle aangrensend is of nie, solank hulle in dieselfde landdrosdistrik geleë is en as 'n eenheid bedryf word. Plase of stukke grond wat in verskillende landdrosdistrikte geleë is, is as afsonderlike boerderyeenhede beskou. Die getal boerderyeenhede verteenwoordig dus nie die getal boere nie, aangesien 'n bepaalde boerderyeenheid deur meer as een boer bedryf kan word en 'n bepaalde boer meer as een boerderyeenheid kan bedryf.

2.3 Boer - Die boer is die persoon, onderneming of instelling wat die boerdery vir eie gewin bedryf, ongeag aan wie die grond waarop geboer of om 'n deel geboer word, behoort.

3 VERGELYKBAARHEID MET VORIGE OPNAMES

3.1 Wanneer besonderhede van hierdie opname met dié van die vorige opnames vergelyk word, moet veral die volgende in gedagte gehou word:

- Inligting wat in die verslag gepubliseer word, is verkry deur middel van 'n 10%-steekproefopname van die boerderyeenhede en is verhef om die totaal van alle boerderyeenhede te dek.
- Verandering in die grense van geografiese gebiede.
- Wisselende klimaatstoestande.
- Veranderings in boerderyvertakkings/wisselbou.

3.2 In gevalle waar die slag, bewerking en verpakking van hoenders deur die boer as 'n integrale deel van die hoenderboerdery op dieselfde boerderyeenheid onderneem word, is hierdie aktiwiteite, onder landbou geklassifiseer. Soortgelyk is die droog/verwerking van teeblare, indien dit tesame met die verbouing van die tee op dieselfde boerderyeenheid onderneem word, onder landbou geklassifiseer. Voor 1988 is beramings van die omvang van hierdie "fabriekswese"-aktiwiteite gemaak en uitgesluit uit die landbousensusse/-opnames.

3.3 In gevalle waar veeboere, benewens hul normale boerdery-aktiwiteite, ook met vee gespekuleer het, is hierdie inkomste ingesluit. Voor 1988 is spekulasie-bedrywighede uitgesluit uit die landbousensusse/-opnames.

3.4 Statistiese streke wat wesenlik beïnvloed is deur die swak reaksie van respondente, is statistiese streke 01, 02, 03, 05, 07, 08, 12, 16, 17, 19, 21, 23, 24, 26 tot 31, 35, 37, 39, 41 tot 43, 46, 48, 49, 50, 52, 55, 56, 61 tot 65, 67, 68, 70, 71, 74 tot 77 en 79; terwyl statistiese streke 48 en 50 en 71 tot 78 sodanig beïnvloed is dat hulle gegewens gekombineer moes word.

4 AKKURAATHEID VAN OPNAMERESULTATE

By 'n steekproefopname word die steekproefgegewens gebruik om op 'n wetenskaplike wyse afleidings of inferensies omtrent die universum (of die "totaal" waaruit die steekproef geselekteer is, in hierdie bepaalde geval die landbousektor), te maak. Die steekproefresultate kan dus afwyk of verskil van die "werklike" (hoewel onbekende) universumwaardes. Die laasgenoemde waardes is dié wat verkry sou gewees het indien die hele universum by wyse van dieselfde vraelys en opnamewyse opgeneem was. In hierdie verband word in die geval van 'n enkele steekproef na die verskil tussen die waargenome steekproefskatting en die universumwaarde (as alle moontlike gevalle in ag geneem is) as die steekproeffout verwys. Dit sal opgelet word dat die steekproeffout nie bereken kan word nie bloot omdat die universumwaarde onbekend is, maar nogtans maak die statistiese teorie dit moontlik om 'n aanduiding van die akkuraatheid van die steekproefberaming te kry.

Op veronderstelling dat 'n betroubaarheid van byvoorbeeld 95% met die uiteindelike steekproefbevinding geassosieer wil word, kan bereken word wat die maksimum verskil tussen die steekproefberaming en die universumwaarde kan wees (weliswaar in die geval van herhaalde steekproefneming onder dieselfde omstandighede). Hierdie maksimum moontlike afwyking tussen die steekproefberaming en die universumwaarde kan bereken word uit die steekproefgegewens, ooreenkomstig 'n sekere graad van betroubaarheid, en staan as die presisie van die steekproefberaming bekend. Ofskoon 'n bepaalde steekproefskatting dus absoluut korrek mag wees, dui die presisie in werklikheid op die maksimum foutegrens (positief of negatief) waaraan dit in die algemeen ooreenkomstig 'n sekere graad van betroubaarheid onderhewig is.

Statisties gesproke, word die presisie van 'n steekproefberaming of -skatting bereken as die produk van die betrokke sogenaamde standaardfout en die betroubaarheidskoëffisiënt (wat 1,96 met betrekking tot 'n 95%-betroubaarheid is, op aanvaarding van normaliteit vanweë die baie groot steekproef). Die voornoemde standaardfoute word vir die eerste maal deur die SSD ten opsigte van die vernaamste landbousteekproefskattings verstrek. Dit word aan die hand gedoen dat dit geïnterpreteer word in terme van die voortvloeiende presisie van die betrokke steekproefberaming. Byvoorbeeld, in die geval van totale boerderyskuld is die skatting vir Streek E R1 306 680 000 met 'n presisie van R256 954 000, ooreenkomstig 'n betroubaarheid van 95% - dit beteken dat dit 95% seker is dat die "werklike" boerderyskuld tussen R1 049 726 000 en R1 563 634 000 is.

Die standaardfout, gedefinieer as die vierkantswortel van die variansie, is 'n maatstaf in dieselfde eenhede as die beraamde waarde (bv. hektaar en randwaarde).

Die standaardfoute (en ook die presisie) van die onderskeie steekproefskattings kan egter nie sondermeer onderling met mekaar vergelyk word nie (in ieder geval nie as die grootte-orde van die skattings en/of die eenhede waarin die waardes uitgdruk is, verskil nie). Die vergelyking van die standaardfout van een skatting met die standaardfout van 'n ander skatting is oor die algemeen sinvol deur gebruikmaking van die variasiekoëffisiënt. Die variasiekoëffisiënt, wat gedefinieer word as die standaardfout gedeel deur die betrokke steekproefskatting, is 'n relatiewe verspreidingsmaatstaf. So, byvoorbeeld, is die feit dat die standaardfout van boerderyskuld vir Streek E (R131 099 000) ongeveer gelyk aan dié vir Streek H (R132 745 000) is, nie 'n aanduiding dat die skatting van boerderyskuld vir Streke E en H ewe akkuraat is nie. As in aanmerking geneem word dat die boerderyskuld van Streek E byna dubbel so groot is as dié van Streek H, blyk dit duidelik dat dit inderdaad nie die geval is nie. Uit die variasiekoëffisiënttabel kan gesien word dat dié maatstaf ten opsigte van die twee skattings inderdaad wesenlik verskil, te wete 10,0% teenoor 18,4%. In die onderstaande tabel word die variasiekoëffisiënt uitgedruk as 'n persentasie.

Variasiekoëffisiënt						
Ontwikkelingstreek	Oppervlakte	Besoldigde werkers	Salarisse en lone	Bruto boerderyinkomste	Lopende uitgawes	Boerderyskuld

Benewens die bogemelde moontlike steekproeffoute, is daar ook ander moontlike opnamefoute. Laasgenoemde sogenaamde nie-steekproeffoute spruit gewoonlik uit tekortkominge, foute en sydighede by fasette soos die vraelysontwerp, verstrekking van gegewens, kodering, dataverwerking en die hantering van respondente wat nie besonderhede verstrek het nie. Die SSD trag om hierdie foute te verklein deur middel van navorsing, opleiding en verskeie kontroleprosedures. Die voorkoms van nie-steekproeffoute is egter nie volkome onafwendbaar nie en dit is ook nie moontlik om die mate waartoe dit die gegewens in hierdie verslag beïnvloed, te raam nie.

Die totale getal en totale oppervlakte van boerderyeenhede toon skommelinge van jaar tot jaar. Hierdie verskille kan onder andere toegeskryf word aan:

- Teenstrydighede in die oppervlakte wat van jaar tot jaar deur individuele boere aangegee word.
- Jaarlikse wisselinge in die totale getal en die totale oppervlakte van boerderyeenhede wat opgeneem word as gevolg van byvoorbeeld wisselinge in die samestelling van boerderyeenhede en tydelik onbewoonde (onaktiewe) boerderyeenhede wat nie in die opname ingesluit word nie.
- Voortdurende onttrekking van grond vir mynbou-, nywerheids-, handel- en woondoeleindes.

EXPLANATORY NOTES

1 SCOPE OF THE AGRICULTURAL SURVEY

1.1 For purposes of the agricultural survey farming means -

- the cultivation of field crops, fruit, grapes, nuts, seeds, bulbs, vegetables or flowers;
- nurseries, excluding those predominantly engaged in purchasing and reselling;
- the operation of tea, coffee, sugar, timber or other plantations;
- the breeding of livestock, game, poultry, furred animals and other animals and freshwater fish; and
- the production of milk, wool, fur, eggs or honey,

for commercial purposes.

1.2 Data in respect of agricultural holdings in urban areas, i.e. areas having some form of local authority, are included in this report only in those cases where the products were intended for sale, such as nurseries, vegetable gardens, flower farms and dairy farms.

1.3 The data refer to farmers in the Republic of South Africa who worked their own or rented farms or farmed land on shares. Data in respect of farmers and farming units in the self-governing territories are excluded.

2 DEFINITIONS AND CONCEPTS USED

2.1 Survey year - Details relating to the area of the farming unit, the number of working proprietors/tenants and members of the family and the number of paid employees/farm employees were called for as at 28 February 1990, while farming debt refers to 31 December 1989. Employees' remuneration, gross farming income and expenditure, equipment purchased and the amount spent on the erection of buildings and development work undertaken, refer to the financial year which ended on any date between 1 March 1989 and 28 February 1990, while the market value of farming assets were called for as at the end of the financial year.

2.2 Farming unit - A farming unit consists of one or more separate farms, holdings or portions of land whether contiguous or not, provided they are situated in the same magisterial district and are operated as a single unit. Farms or portions of land situated in different magisterial districts are regarded as separate farming units. The number of farming units, therefore, do not represent the number of farmers, as a specific farming unit can be operated by more than one farmer, and one farmer can operate more than one farming unit.

2.3 Farmer - The farmer is the person, enterprise or establishment conducting farming operations for his/its own account, irrespective of the ownership of the land farmed or farmed on shares.

3 COMPARABILITY WITH PREVIOUS SURVEYS

3.1 In comparing the results of this survey with those of previous surveys the following should particularly be borne in mind:

- Information published in this report is acquired by means of a 10% sample survey of the farming units and is raised to cover the total of all farming units.
- Alterations in the boundaries of geographical areas.
- Fluctuating climatic conditions.
- Alterations in branches of farming. Rotation of crops.

3.2 In cases where the slaughtering, processing and packing of poultry are undertaken by the farmer as an integral part of poultry-farming on the same agricultural unit, these activities are classified under agriculture. The drying/processing of tea leaves, if undertaken by the farmer in conjuntion with the cultivation of tea on the same agricultural unit, is similarly classified under agriculture. Before 1988 estimates of the extent of these "manufacturing" activities were made and excluded from the agricultural censuses/surveys.

3.3 In cases where stock-farmers, in addition to their normal farming activities, also speculate with livestock, this income has been included. Before 1988 speculation activities were excluded from the agricultural censuses/surveys.

3.4 Statistical regions substantially effected by the poor response of respondents are statistical regions 01, 02, 03, 05, 07, 08, 12, 16, 17, 19, 21, 23, 24, 26 to 31, 35, 37, 39, 41 to 43, 46, 48, 49, 50, 52, 55, 56, 61 to 65, 67, 68, 70, 71, 74 to 77 and 79; while statistical regions 48 and 50 and 71 to 78 were effected to such an extent that their data had to be combined.

4 ACCURACY OF SURVEY RESULTS

In a sample survey the sample data are used to make deductions or inferences regarding the "universe" (or the total from which the sample is selected, in this particular case the agricultural sector) on a scientific basis. The sample results can thus deviate or differ from the "true" (albeit unknown) universe values. The latter values are those that would have been obtained if the whole universe had been surveyed by way of the same questionnaire and survey method. In this regard, in the case of a single sample, the difference between the observed sample estimate and the universe value (if all possible cases are taken into account) is referred to as the sample error. It will be noted that the sample error can not be calculated, simply because the universe value is unknown. Statistical theory, nevertheless makes it possible to obtain an indication of the accuracy of the sample estimate.

Assuming that it is intended to associate a reliability of, for example, 95% with the ultimate sample result, it can be calculated what the maximum difference between the sample estimate and the universe value could be (strictly speaking, in the case of repeated sampling under the same circumstances). This maximum possible deviation between the sample estimate and the universe value can be calculated from the sample data, corresponding to a certain degree of reliability, and is known as the precision of the sample estimate. Although a particular sample estimate may thus be absolutely correct, the precision in fact indicates the maximum error margin (positive or negative) which it is generally subject to, corresponding to a certain degree of reliability.

Statistically speaking, the precision of a sample estimate is calculated as the product of the relevant so-called standard error and the reliability coefficient (which is 1,96, with regard to a 95% reliability, assuming normality because of the very large sample). The aforementioned standard errors are furnished for the first time, with regard to the most important sample estimates on agriculture, by the CSS. It is suggested that they are interpreted in terms of the resulting precision of the relevant sample estimate. For example, in the case of farming debt the estimate for Region E is R1 306 680 000 with a precision of R256 954 000, corresponding to a reliability of 95% - this means that it is 95% certain that the "true" farming debt lies between R1 049 726 000 and R1 563 634 000.

The standard error, defined as the square root of the variance, is a measure of the sampling error in the same units as the estimate (e.g. hectare and rand value).

The standard errors (as well as the precision) of the various sample estimates cannot, however, merely be compared with one another (in any case not if the order of magnitude of the estimates and/or the units in which the values are expressed, differ). The comparison of the standard error of one estimate with the standard error of another estimate is, in general, meaningful if use is made of the coefficient of variation. The coefficient of variation, defined as the standard error divided by the relevant sample estimate is a relative measure of dispersion. For example, the fact that the standard error of farming debt for Region E (R131 099 000) is approximately equal to that of Region H (R132 745 000) does not imply that the estimates of farming debt for Regions E and H are equally accurate. Taking into account that the farming debt of Region E is almost twice that of Region H it is clear that this is not the case. From the table of coefficients of variation it is obvious that this measure differs substantially with respect to the two estimates, namely 10,0% and 18,4%. In the following table the coefficients of variation are expressed as a percentage.

Coefficient of variation						
Development region	Area	Paid employees	Salaries and wages	Gross farming income	Current expenditure	Farming debt

Apart from the above-mentioned sampling errors, other survey errors may also be present. These so-called non-sampling errors are usually the result of imperfections, errors and biasses in questionnaire design, furnishing of particulars, coding, data processing and the treatment of non-response. The CSS attempts to minimize these errors by means of research, training and various checking procedures. Non-sampling errors can never be completely eliminated and it is also not possible to estimate the extent to which they influence the data in this report.

5 NOTES TO TABLES

5.1 Table 1 - Principal statistics

5.1.1 Farming units

The total number and the total area of farming units reflect fluctuations from year to year. These differences can be ascribed, inter alia, to:

- Inconsistencies in the areas reported from year to year by individual farmers.
- Annual fluctuations in the total number and the total area of the farming units enumerated as a result of, for example, fluctuations in the composition of farming units and temporarily unoccupied (inactive) farming units, which are not included in the survey.
- Continual withdrawal of land for mining, industrial, commercial and residential purposes.

5.1.2 Tables 1.1 and 1.2
