ACRONYMS

AgSS: Annual Agricultural Sample Survey

CSA: Central Statistical Agency

E.C: Ethiopian Calendars

GDP: Growth Domestic Products

SNNP: South Nations, Nationalities and peoples

Part I

1. Introduction and Objective of the survey

1.1. Introduction

In this report we compiled the 19 years of annual agriculture sample survey of main season which held every year by CSA to provide a time series data to our users. The main season time series data provides a clear visual explanation to the fluctuating nature of data or changes of the cultivated area of land, crop production and crop yields over time. Agriculture, Natural Resource and Environmental Statistics Directorate of CSA produces annual Agriculture sample survey report in every calendar year. The annual cultivated area of land in hectare and its amount of production is the main finding of the annual agriculture survey of CSA's, agriculture, natural resource and environmental statistics directorate. Production per hectare or yield of every crop produced by private peasant holdings during main season production period is also part of the survey findings. The sound performance of agriculture warrants the food crops availability of the country. Agriculture in Ethiopia does not only important for the adequate acquisition of food crops to attained food security, but also plays a magnificent positive role on the Ethiopian economy, as it contributes the significant share for GDP.

There for, the prime role that agriculture plays in a country's political, economic and social stability makes measures of agricultural productions extremely sensitive. The statistical data collected on agricultural productions are, therefore, fraught with questions of reliability by data users. Especially if it compiled by time series, it is easy to access the data of area and production report in every survey period.

Upholding this principle, the Central Statistical Agency (CSA) has been produce a fresh statistical information on the country's agriculture since 1980/81 to alert policy interventionists on the changes taking place in the agricultural sector. The policy maker and other data users are happier in time series data than cross-sectional data, due to they will got more clarification and better idea from the time series data. By understanding our data users interest, the annual Agricultural Sample Survey (AgSS) time series data for nineteen years from 1995/96(1988 E.C) to 2014/15 (2007 E.C.) was compiled to provide data on cultivated area of land, amount of production and crop yields of private peasant holdings for Meher Season. This time series of

main season data is also presented in this bulletin and other electronic media for data users including CSA websites address **www.csa.gov.et**

1.2. Objectives of the Survey

The general objective of CSA's Agricultural Sample Survey (AgSS) Time series data is to provide the basic quantitative information on the country's agriculture cultivated land area, production and it's yield of every crop that are essential for planning, policy formulation, monitoring and evaluation of mainly food security and other agricultural activities. The AgSS is composed of four components: Crop Production Forecast Survey, Meher Season Post Harvest Survey (Area and production, land use, farm management and crop utilization), Livestock Survey and Belg Season Survey.

The specific objectives of Meher Season Post Harvest Survey time series data are to provide the total crop area, volume of crop production and yield of crops for Meher Season agriculture in Ethiopia in one statistical bullet to make access in easiest way for the data users. The report is based on private peasant holdings in rural sedentary areas of the country and part of companion reports on the performance of agriculture in the country. The report is compiled at National and Regional level only.

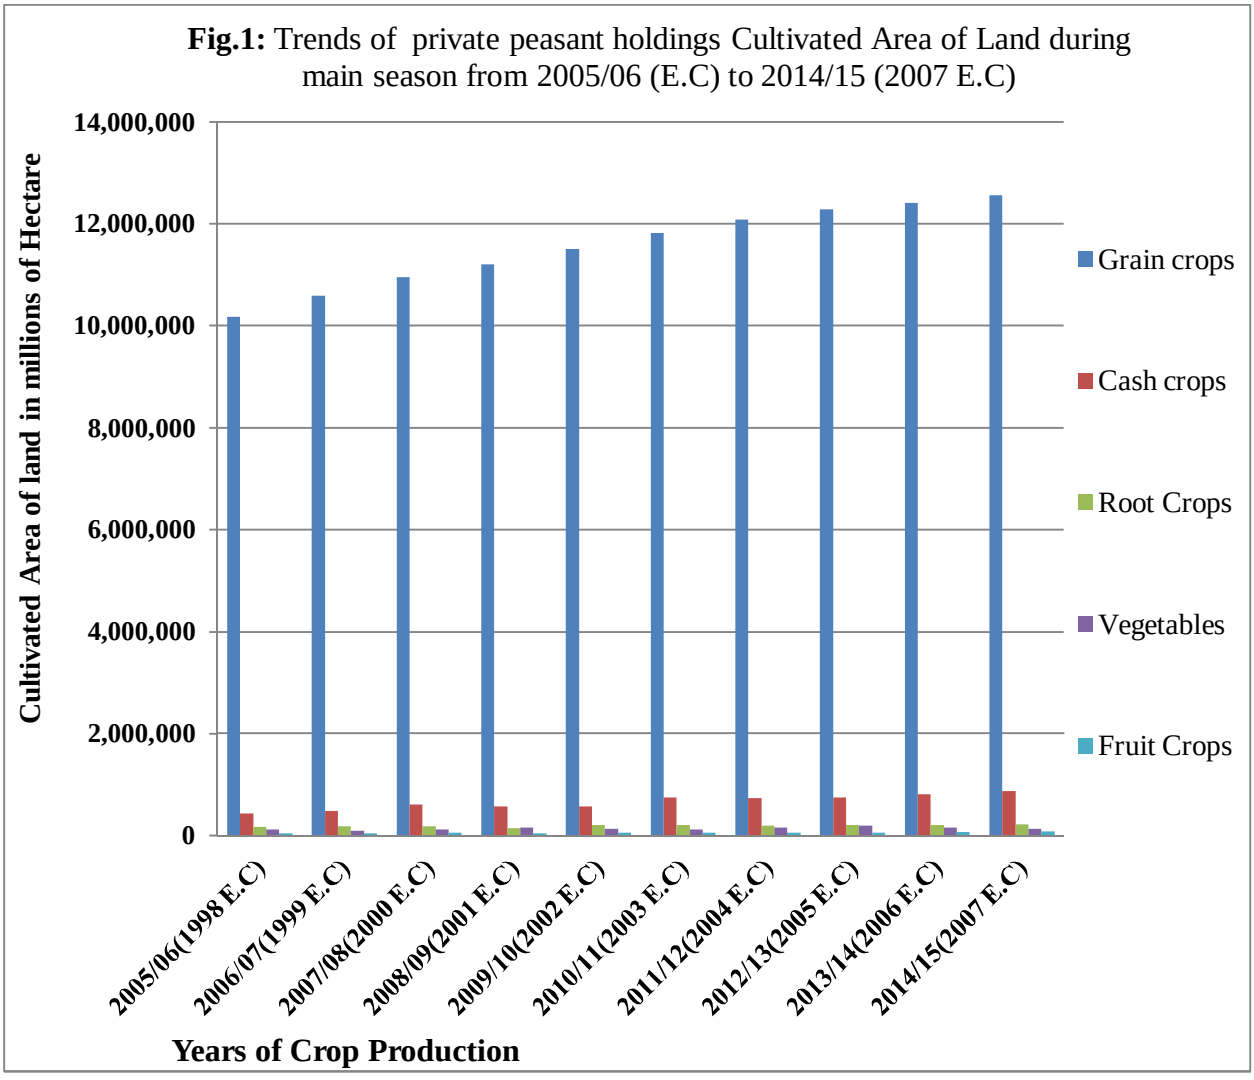
Part II

2. Output interpretations based on the survey result at National level

2.1. Trends of Cultivated Area of land

The cultivated area of land under grain crops are shows a gradual positive change for the last ten consecutive years (see Fig.1). The area covered under grain crops are increase from 10,170,911 hectares in 2005/06 (1998 E.C) to 12,566,240 hectares in 2014/15 (2007 E.C). However, these 2,395,329 hectares of additional cultivated area of land under grain crops are very few in ten years period with compare to the country's cultivable land potential area. The remaining crops (Cash, Root, vegetables and fruit) are covers the cultivated area of less than one million hectare each year.

Fig.1: Trends of private peasant holdings Cultivated Area of Land during main season from 2005/06 (E.C) to 2014/15 (2007 E.C)



2.2. Trends of production of various crops

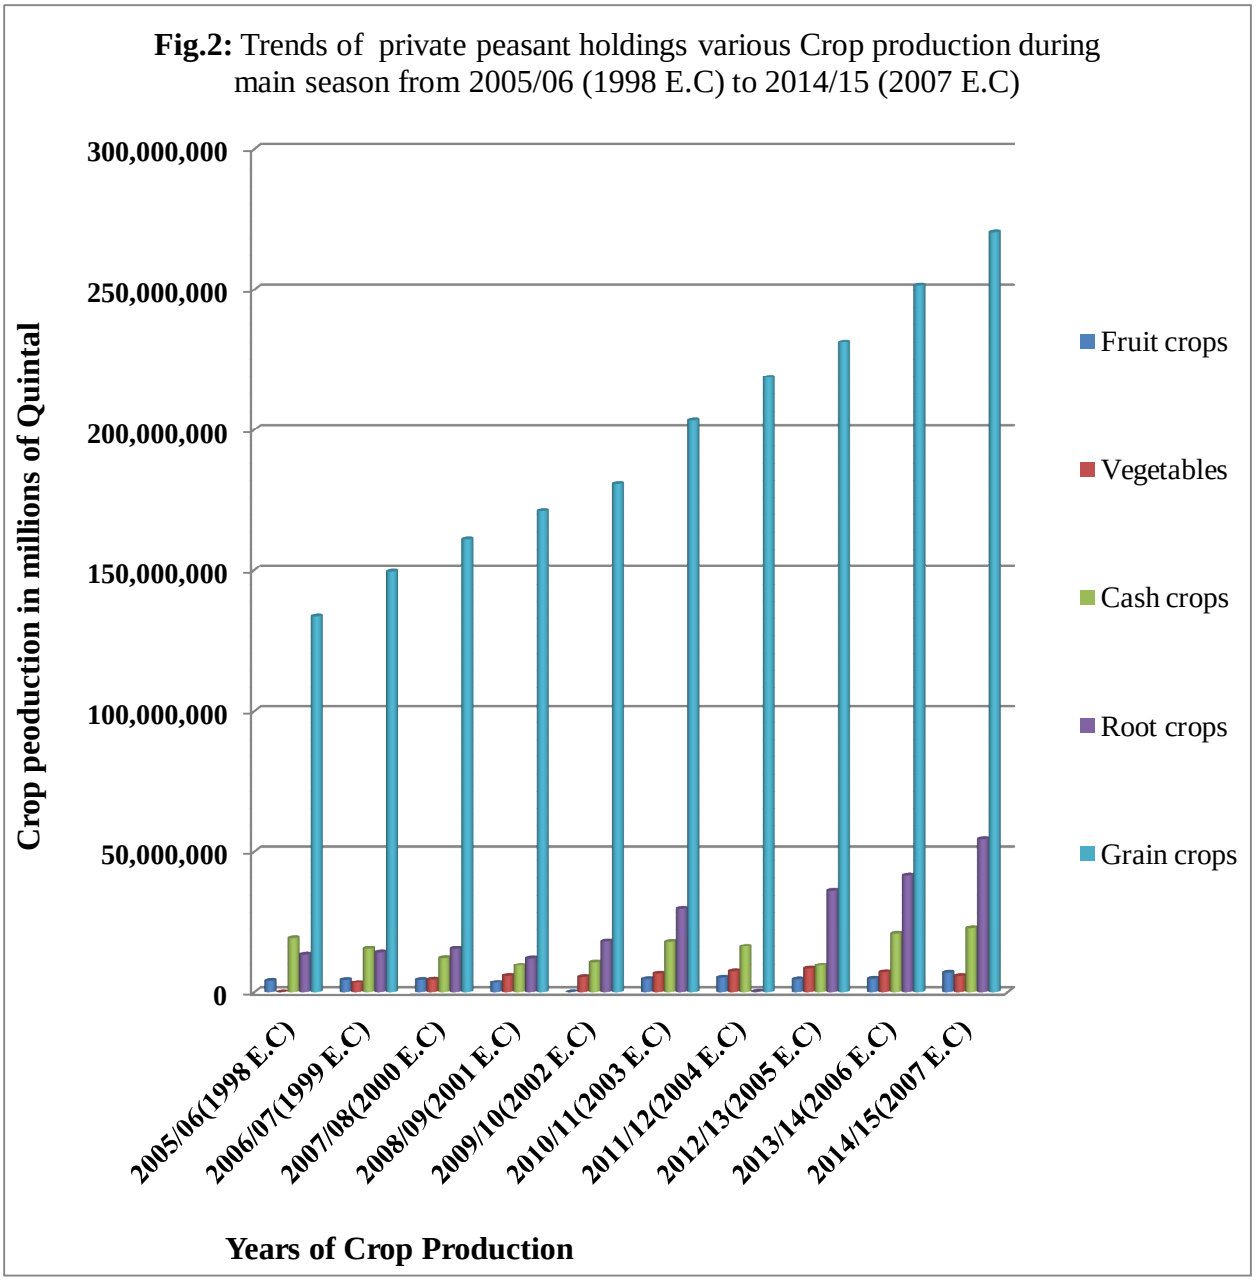
The grain crop production shows a remarkable enhancement in amount of production during each production period. It increases from 133,821,275 quintals in 2005/06 (1998 E.C) to 270,396,048 quintals after ten years later. This significant positive change in grain crops production is not only due to the increments of cultivated area of land size but also due to the enhancements of grain crops productivity. The additional 136,574,773 quintals are produced after ten years by private peasant holdings during the main season production period at national level in Ethiopia.

Root crops are the second mostly produced in Ethiopia during the last ten years (see fig.2). The change of root crop production is also more than four times of the 2005/06 (1998 E.C) production. That is from 13,374,684 quintals in 2005/06 (1998 E.C) to 54,615,540 quintals in 2014/15 (E.C).

The cash crops namely chat; Coffee, Hops and Sugar cane productions are increased from 19,190,967 quintal to 22,943,225 quintals with ten years period. However, the amount of cash crop productions is not significantly changed as compared to the grain and root crops within the same period of production year.

Vegetables and fruit crops production are almost remains constant for the last ten years during the main season production period at national level.

Fig.2: Trends of private peasant holdings various Crop production during main season from 2005/06 (1998 E.C) to 2014/15 (2007 E.C)

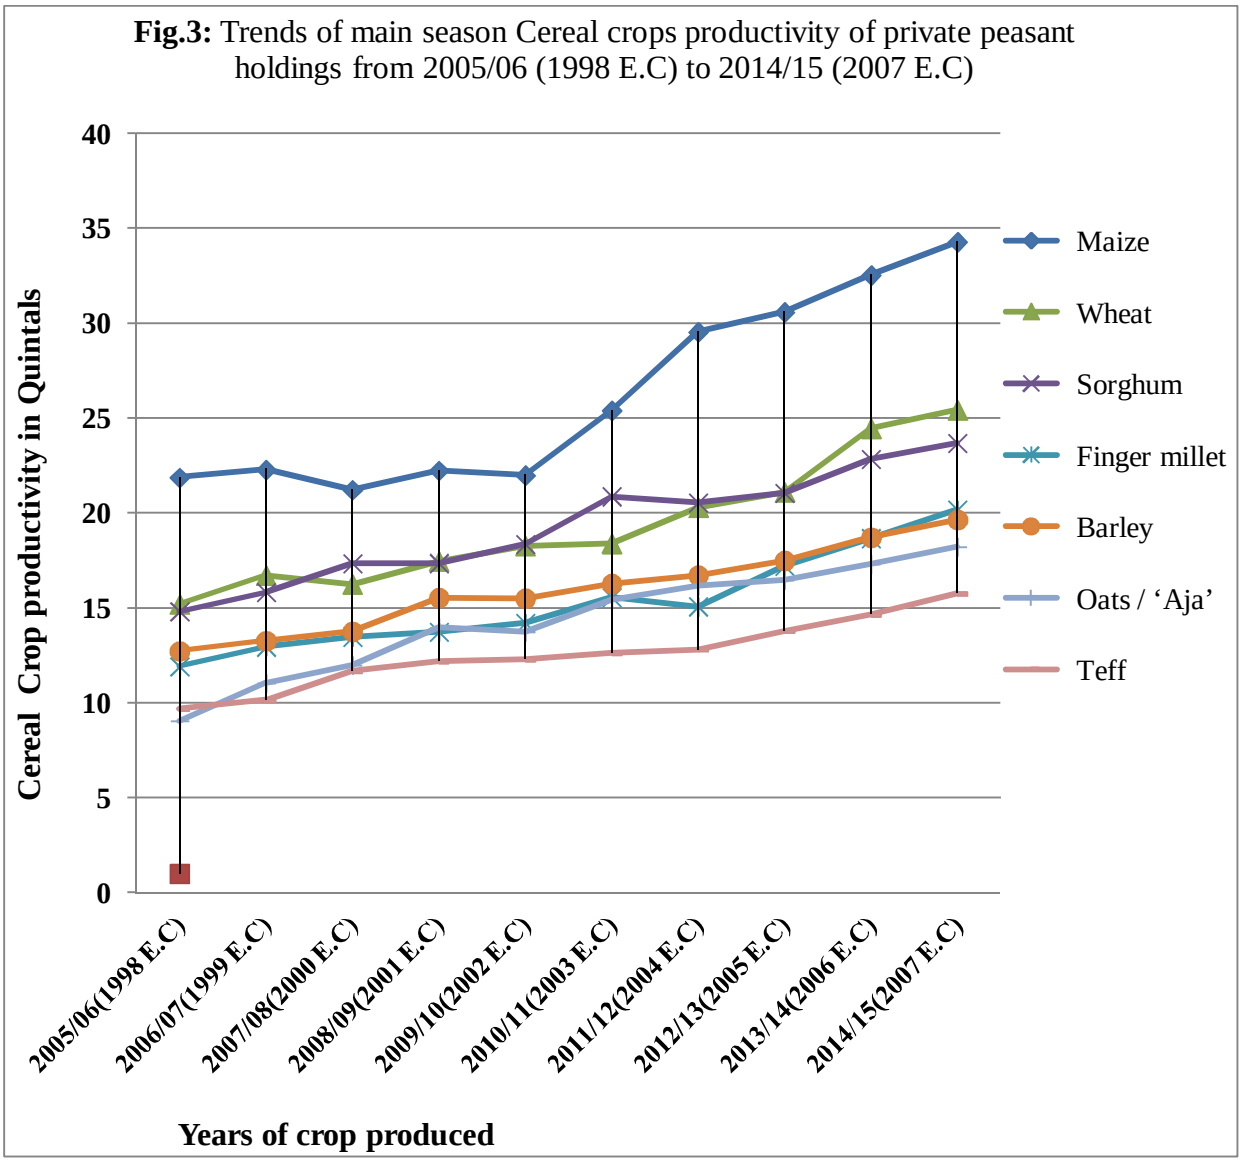


2.3. Trends of major Grain crops productivity/ Crop yield

2.3.1. Cereal crops

Cereal crops productivity was increased at decreasing rate from 2005/06 (1998 E.C) to 2009/10 (2002 E.C) and increase at increasing rate from 2010/11 (2003 E.C) to 2014/15 (2007 E.C). Off all cereal crops productivity, maize shows a tremendous change in productivity for the last five main season production period. However, the Teff crop productivity is the only growing slow in productivity from all cereal crops.

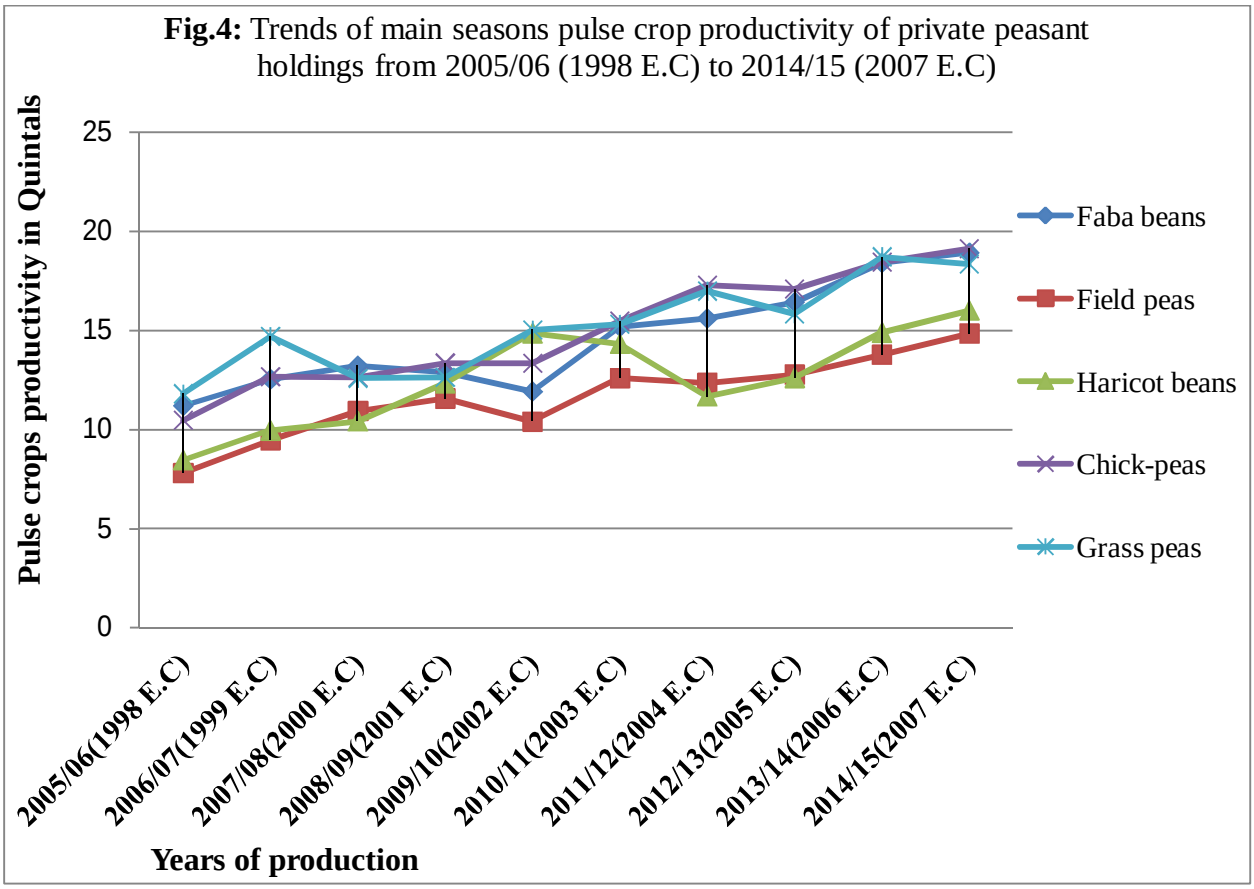
Fig.3: Trends of main season Cereal crops productivity of private peasant holdings from 2005/06 (1998 E.C) to 2014/15 (2007 E.C)



2.3.2. Pulse Crops

The Pulse crops productivity shows a smooth slowly growing in productivity for the last ten production period. Chick-peas, Faba beans and grass peas are almost changed in the same magnitude in productivity from 2010/11 (2003 E.C) to 2014/15 (2007 E.C). Haricot beans and field peas are the area which expected more to work for the enhancement of productivity.

Fig.4: Trends of main seasons pulse crop productivity of private peasant holdings from 2005/06 (1998 E.C) to 2014/15 (2007 E.C)

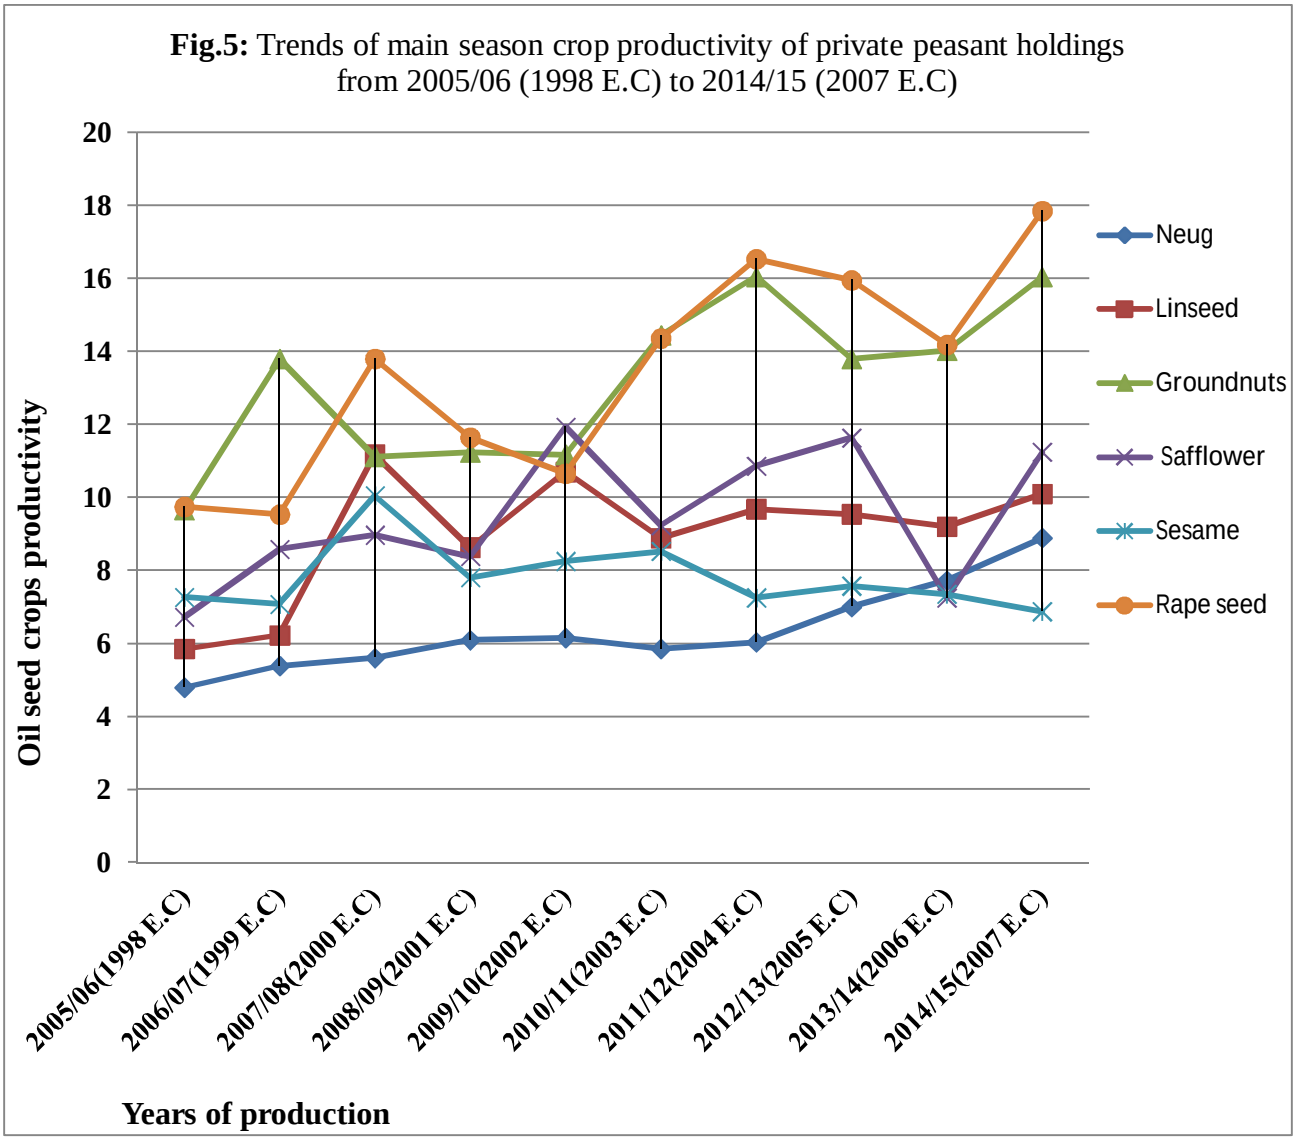


2.3.3. Oil seeds

The oil seeds productivity growing shows very fluctuating trends except Neug crop productivity for the last ten production period. This fluctuation in productivity of oil seed crop are comes from the improper usage of chemical fertilizer inputs by private peasant holdings. For instance, during the period of 2014/15 (2007 E.C), out of the total chemical fertilizer that the private peasant holdings used, only 1.5% is applied for oil seed crop production. Sesame is the only crops that its productivity is declining for the last five years at national level.

The neug crop productivity trend is also varies from year to year during the last ten years. It was increased at initial period then kept constant for three years and it start increasing until the current production period.

Fig.5: Trends of main season crop productivity of private peasant holdings from 2005/06 (1998 E.C) to 2014/15 (2007 E.C)



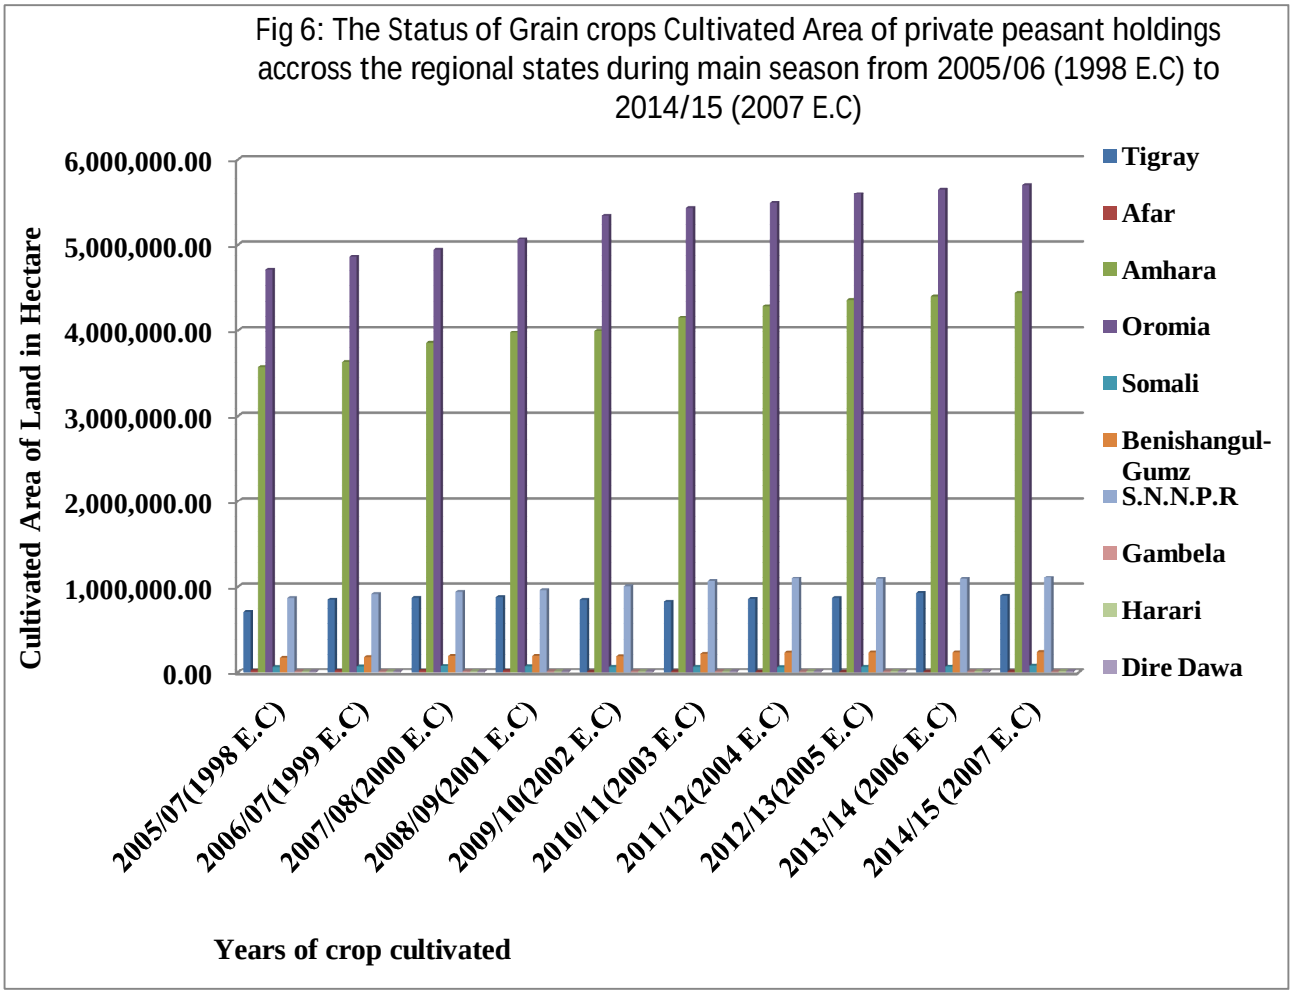
Part III

3. Graphical interpretations based on the survey result at Regional level

3.1. Trends of Cultivated Area of land across the Regional States of Ethiopia

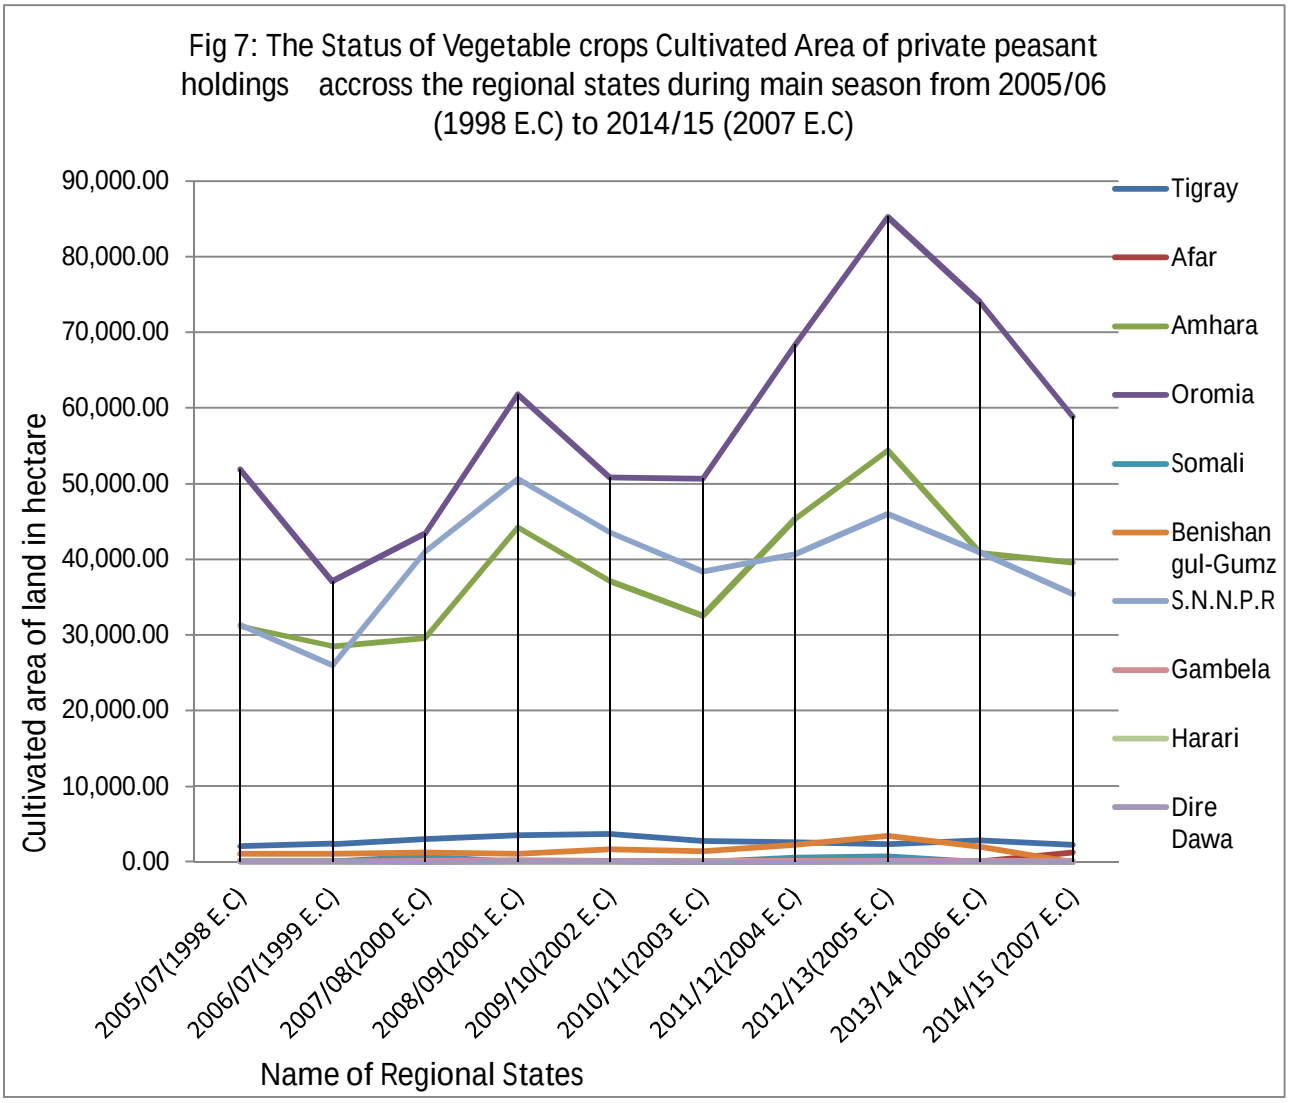
3.1.1 Grain Crops

The cultivated area of land under grain crops is high in Oromia region than any other region for the last ten production period (see fig.1). The size of cultivated area at all region is also shows a smooth growing from 2005/06 (1998 E.C) to 2008/09 (2001 (E.C) and increase at very decreasing rate after 2009/10 (2002 E.C). This implies that the cultivated land scarcity may face the four larger regions (Oromia, Amhara, SNNPR and Tigray). They also take the lion share of cultivated area of land for grain crops respectively.



3.1.2. Vegetable crops

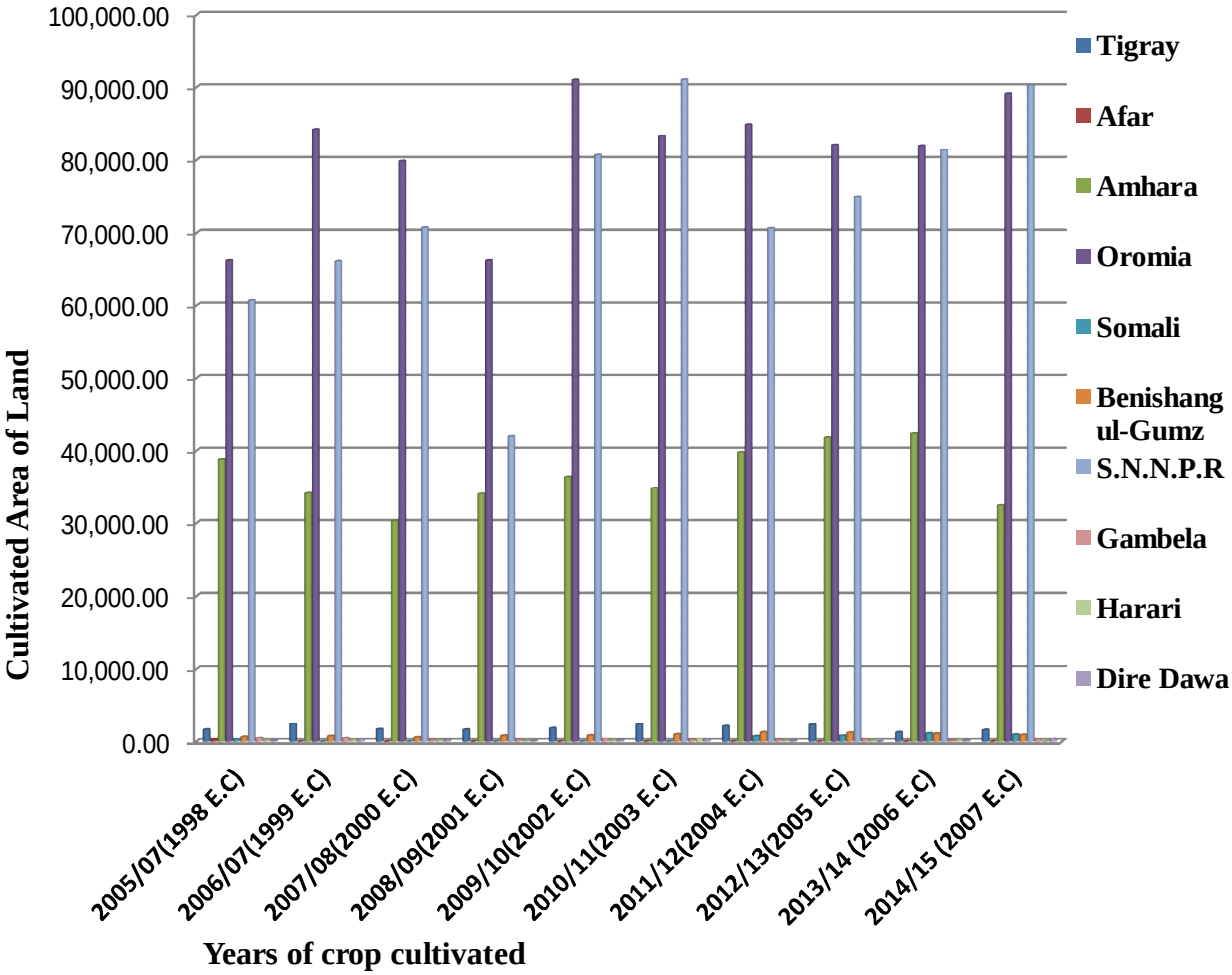
The cultivated area of land under vegetable crops are highly varied due to the private peasant holders use the crop rotation system and crop shift in every production period across the region. Oromia Region is the largest region and cultivates the large size of land for vegetable crops every year when compares with the remaining regions. Amhara and SNNP regions are cultivated almost similar land size on average for vegetable crops. However, Gambela, Harari and Dire Dawa are very few land size cultivated for vegetable crops.



3.1.3. Root crops

The cultivated area of land under root crops in Oromia, SNNP and Amhara regions are shows a smooth and relatively constant trend across the years expect the 2008/09 (2001 E.C) declining in all regions. Oromia and SNNP regions are cultivated the highest land size under root crops in all crop production period. The Tigray region cultivated area for root crops are almost similar land size in each year. The remaining regions of cultivated area of land under root crops are very few in size.

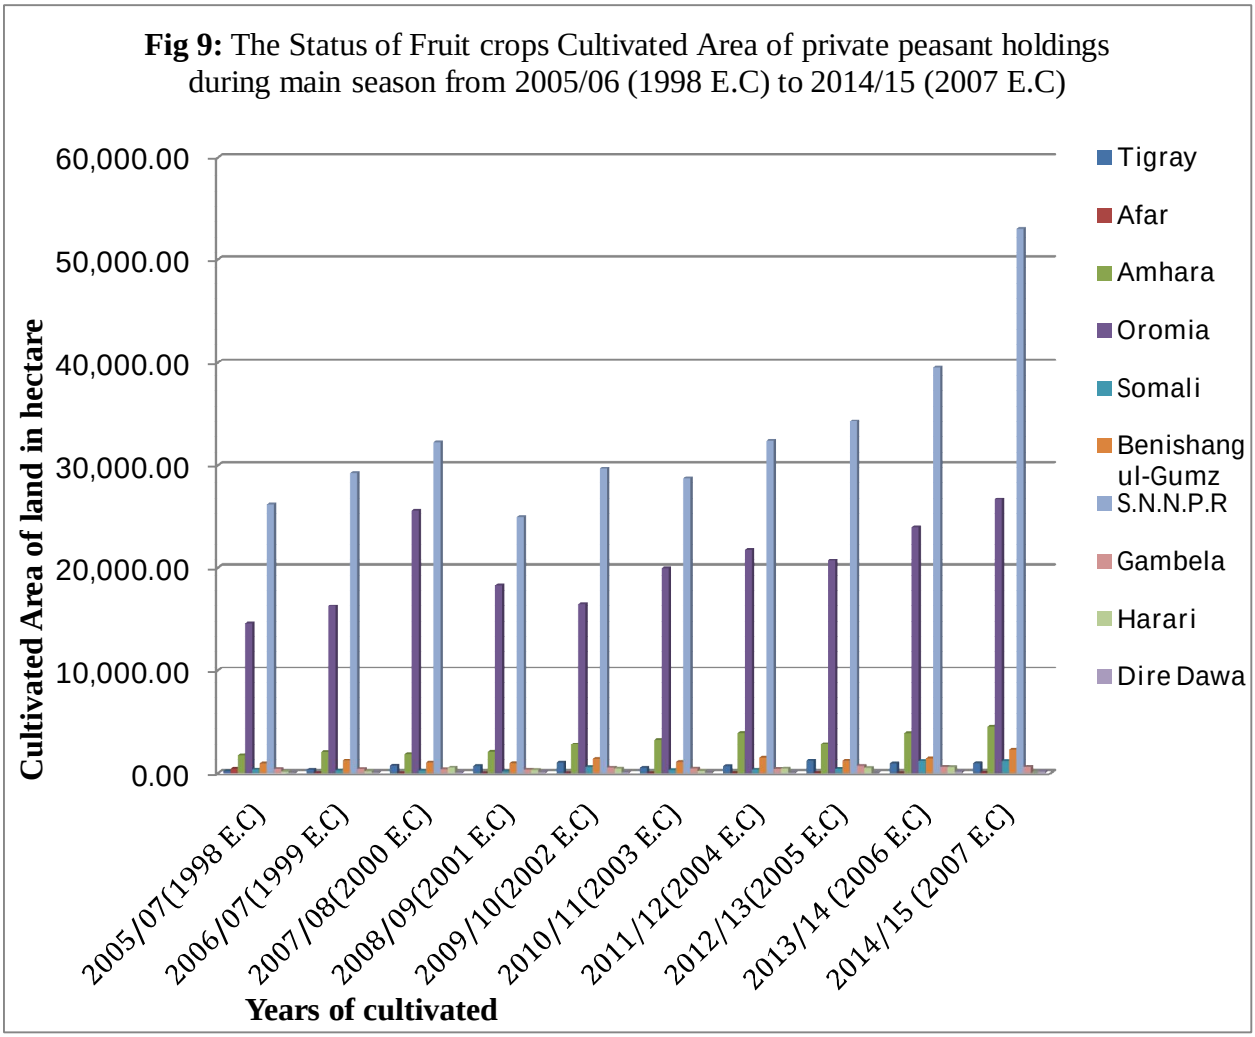
Fig 8: The Status of Root crops Cultivated Area of private peasant holdings during main season from 2005/06 (1998 E.C) to 2014/15 (2007 E.C)



3.1.4. Fruit crops

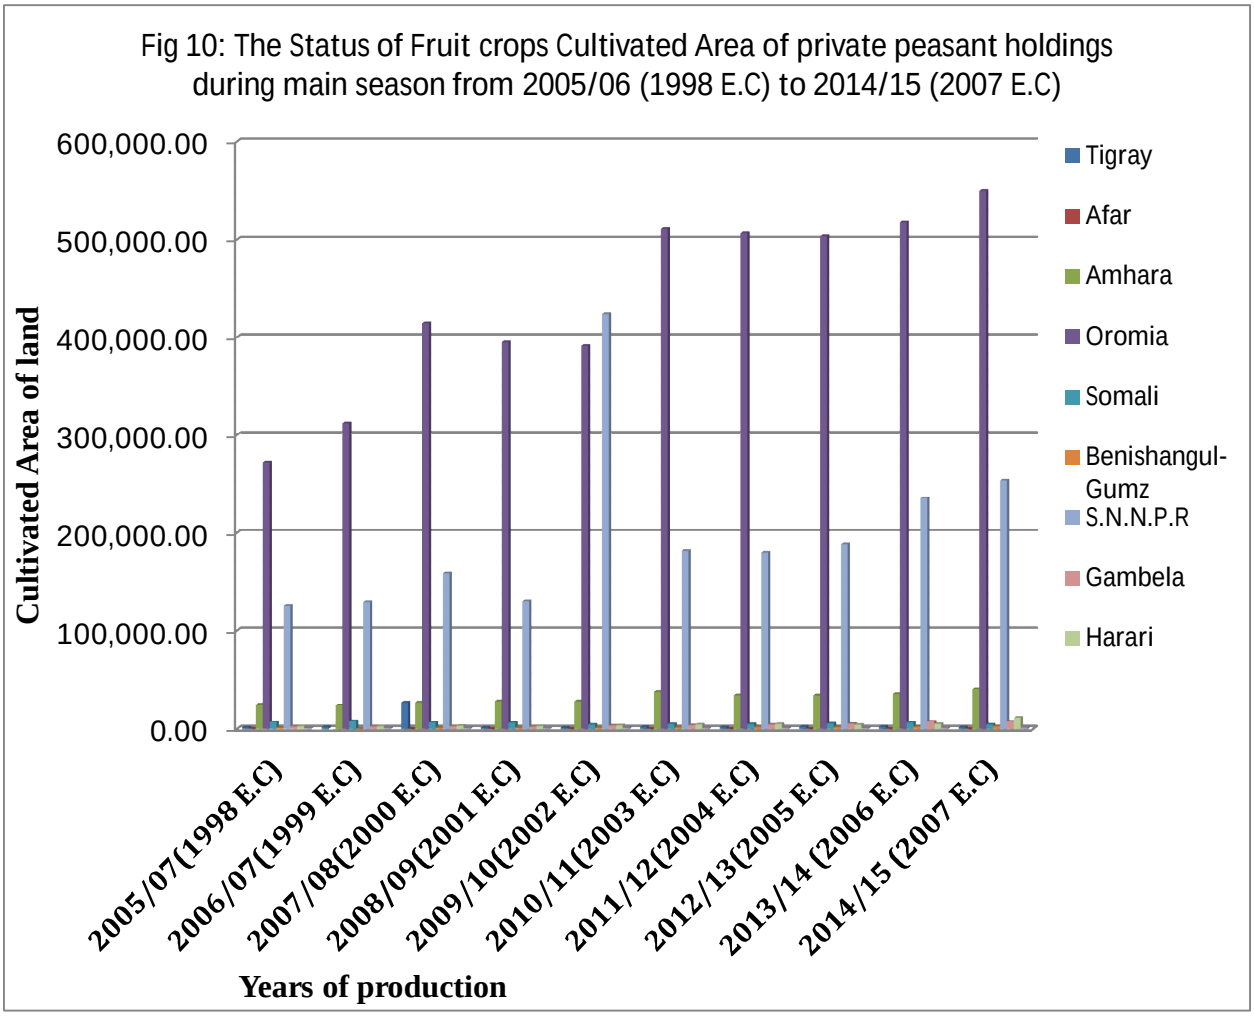
SNNP region's cultivated area of land under fruit crops are shows a tremendous incremental trend for the last ten years except the year of 2008/09 (2001 E.C). It increases from 26,000 hectares in 2005/06 (1998 E.C) to more than a double after 10 years which about 53,000 hectares in 2014/15 (2007 E.C). Oromia is the second most cultivated land size under fruit crops next to SNNP and which shows a gradual increment in cultivating land size for fruit crops across the year. The cultivated land size is also shows smooth incremental trends in Amhara region. The practice of other region to cultivate land for fruit crops is remaining minimal.

Fig 9: The Status of Fruit crops Cultivated Area of private peasant holdings during main season from 2005/06 (1998 E.C) to 2014/15 (2007 E.C)



3.1.5. Cash crops

In cultivating land for Cash crop production, Oromia the most dominant region and followed by SNNP. The cultivated land size is shows an annual increment for all regions under cash crops. However, the trend shows that the cultivated land area for cash crop is mainly comes from oromia and SNNP regions in Ethiopia.

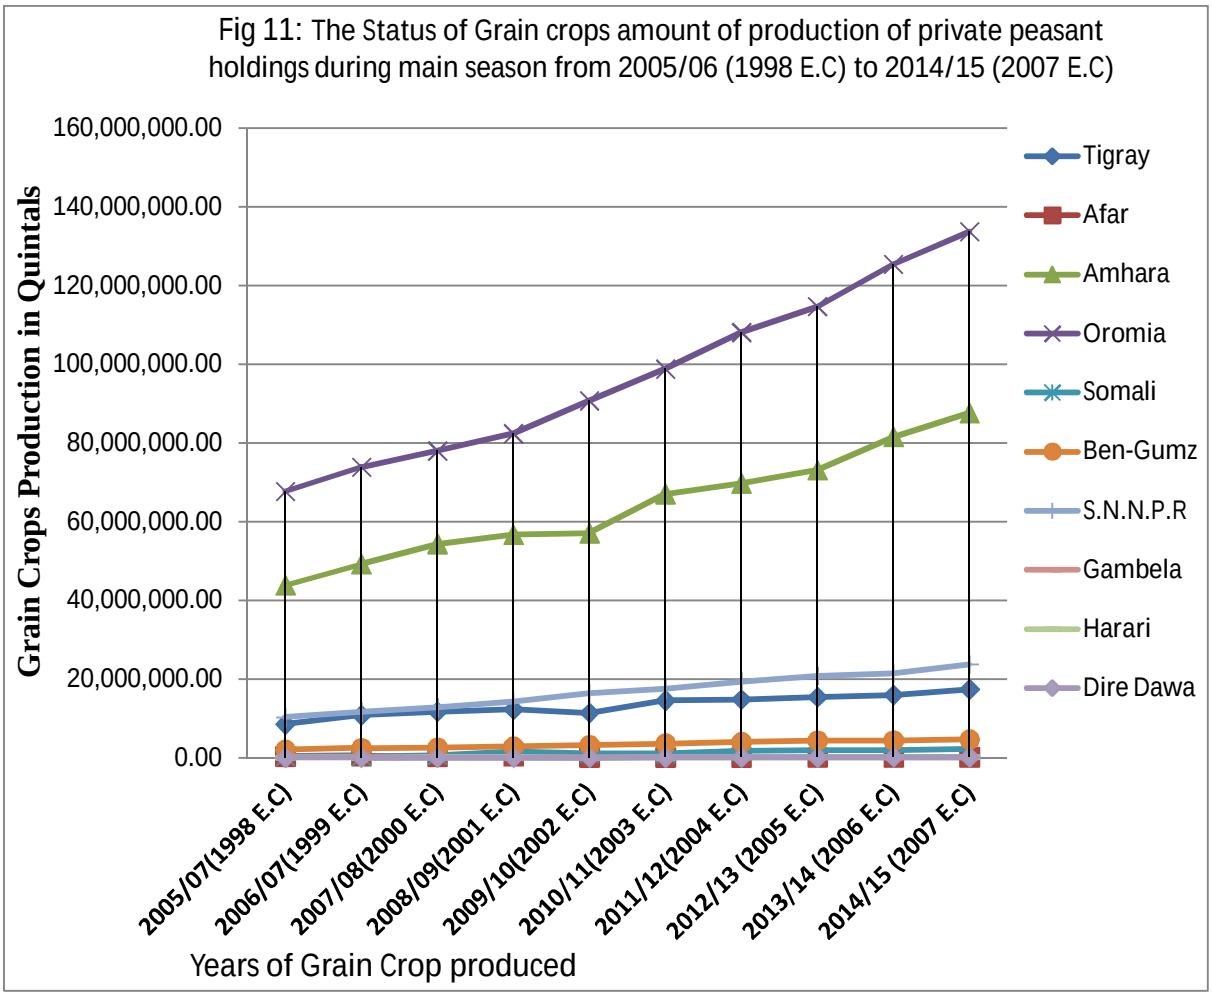


3.2. Trends of Various crop productions Across the Regions

3.2.1. Grain Crops

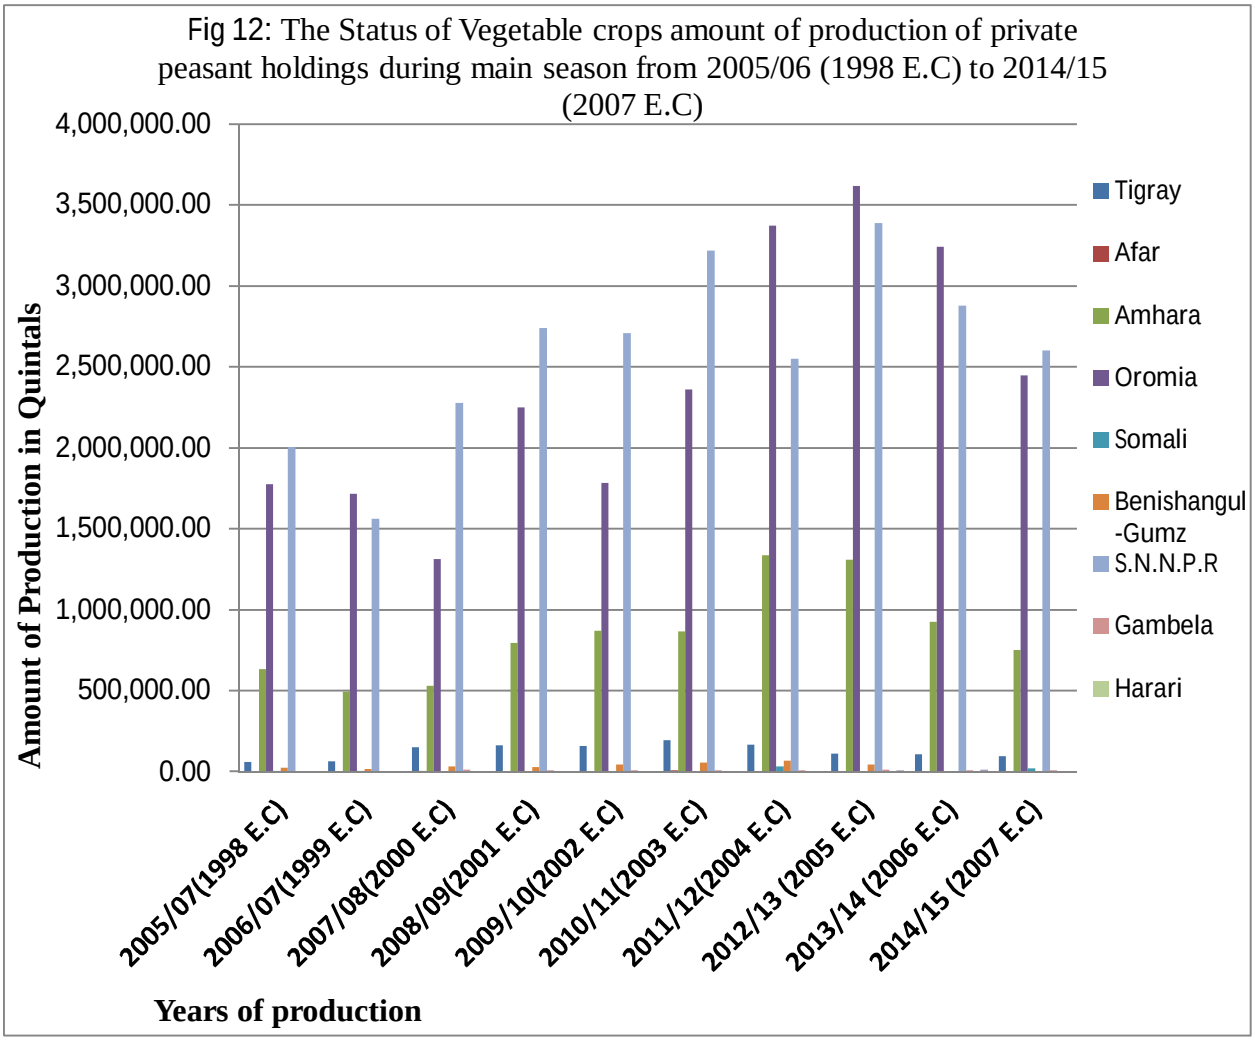
The trend of the last ten years survey shows that, the major proportion of grain crop production of Ethiopia is comes from one region i.e. Oromia. The amount of production gap between oromia region and the other region is very large. For instance, the production difference between oromia region and the second most grain crop producer, Amhara region is almost twice. The trend of grain crop production shows a tremendous increment in both Oromia and Amhara region for the last ten production period. The increment in production was almost in double after ten years later in both regions. It increases from 67,727,140 and 43,854,714 quintal in 2005/06 (1998 E.C) to 133,718,914and 87,637,545 quintals by the year of 2014/15 (2007 E.C) in oromia and amhara region respectively. SNNP and Tigray regions grain crop production was shows a minimum

growth in production during the same period. However, the remaining regions of grain crop production are remaining constant across the all production period.



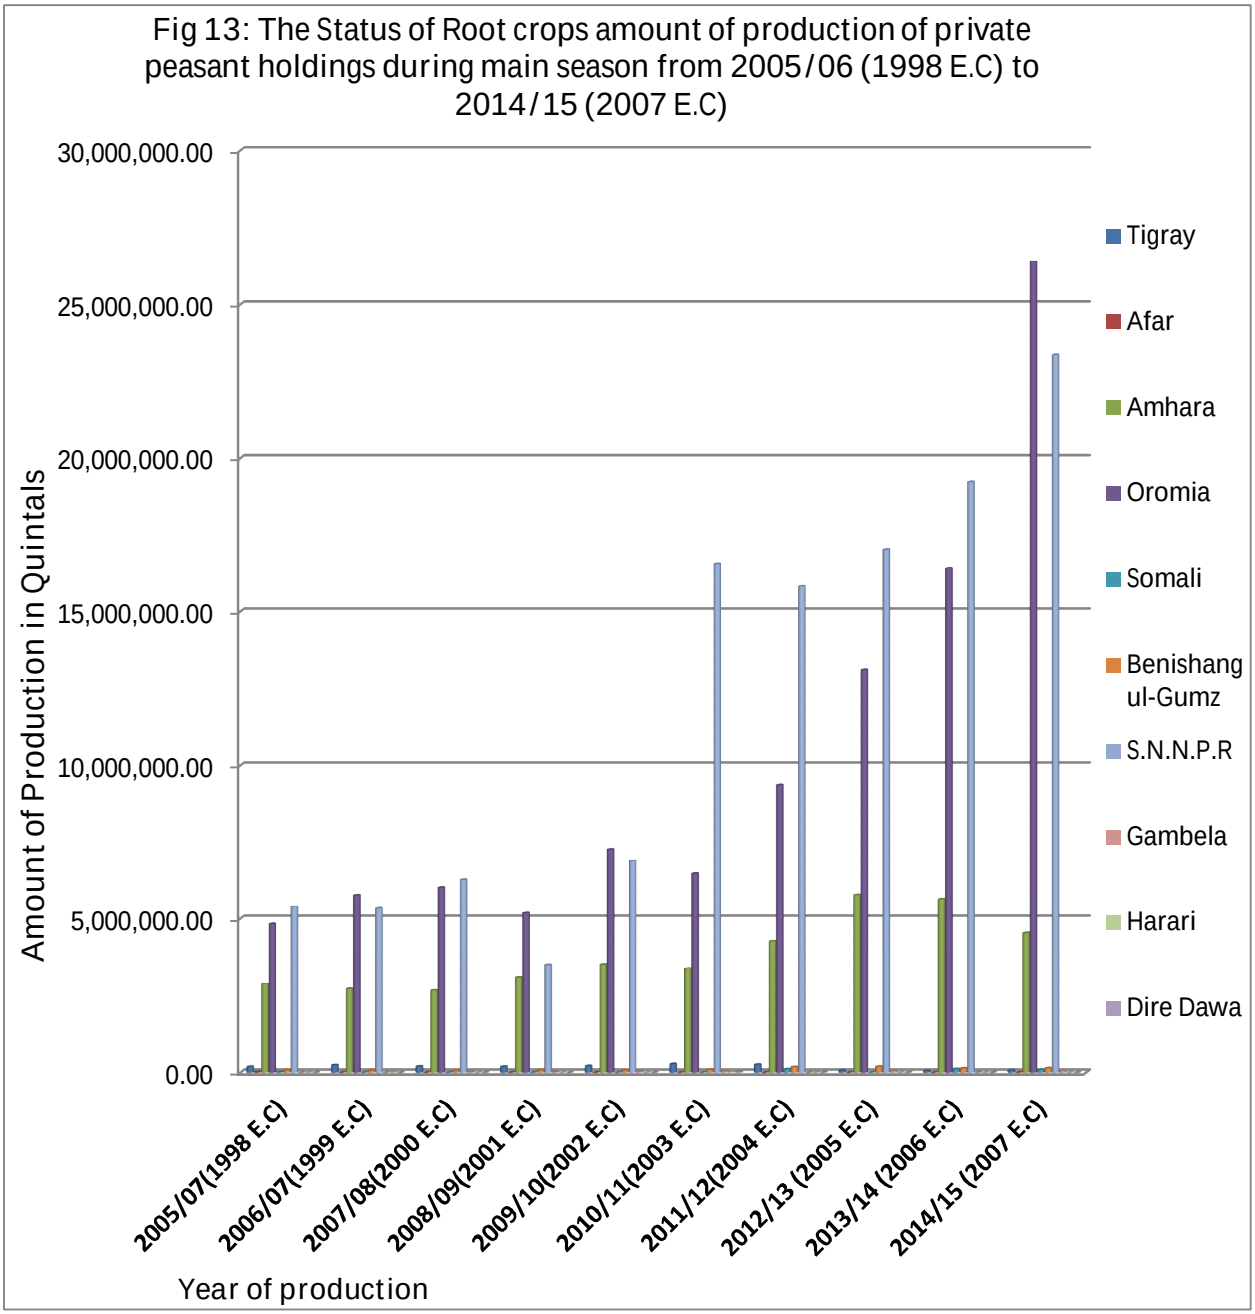
3.2.2. Vegetable crops

The production amount of vegetable crops shows an increasing trend up to the year of2012/13 (2005 E.C) and it starts declining the next two years in all regions of Ethiopia. Oromia and SNNP regions are taking a lead in the size of vegetable crop production amount and Amahara region is the 3rd follower. The one main reason of the latest two years declining in amount of vegetable crop production is that, the cultivated area of land under vegetable crop was decreased across the regions.



3.2.3. Root crops

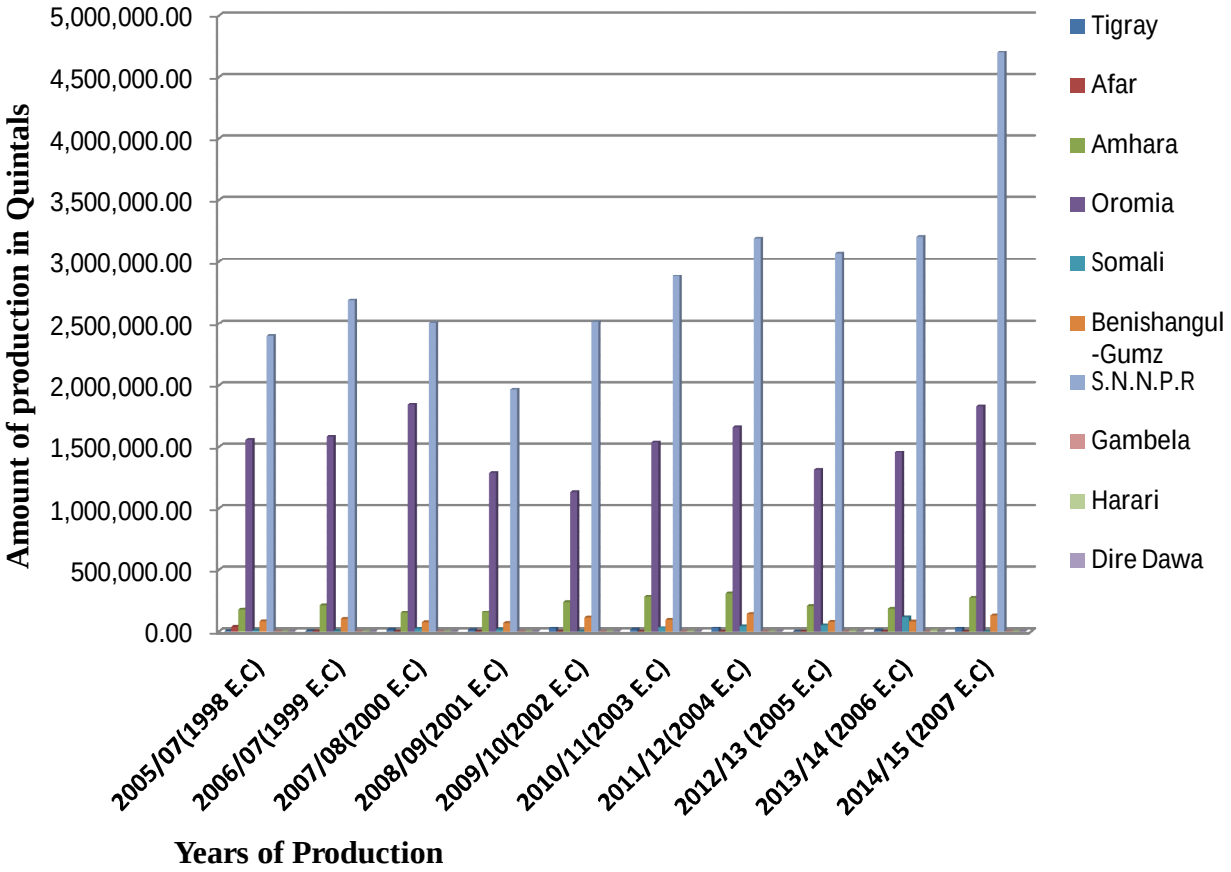
The production of the root crops is varied across the regions due to their potentiality difference. The root crop production amount was similar between Oromia and SNNP from the year of 2005/06 (1998 E.C) to 2009/10 (2002 E.C). However, SNNP was taking a lead by more proportional amount from 2010/11 (2003 E.C) to 2013/14 (2006 E.C) and then taken by Oromia region in 2014/15 (2007 E.C).



3.2.4. Fruit crops

SNNP region were has a large proportion amount from the total fruit crop production in Ethiopia every year. The trend of fruit crop production in SNNP region was also increasing at increasing rate after the year of 2008/09 (2001 E.C). The status of the regions is also shows, Oromia and Amhara regions are the second and the third large fruit crop producer region in Ethiopia.

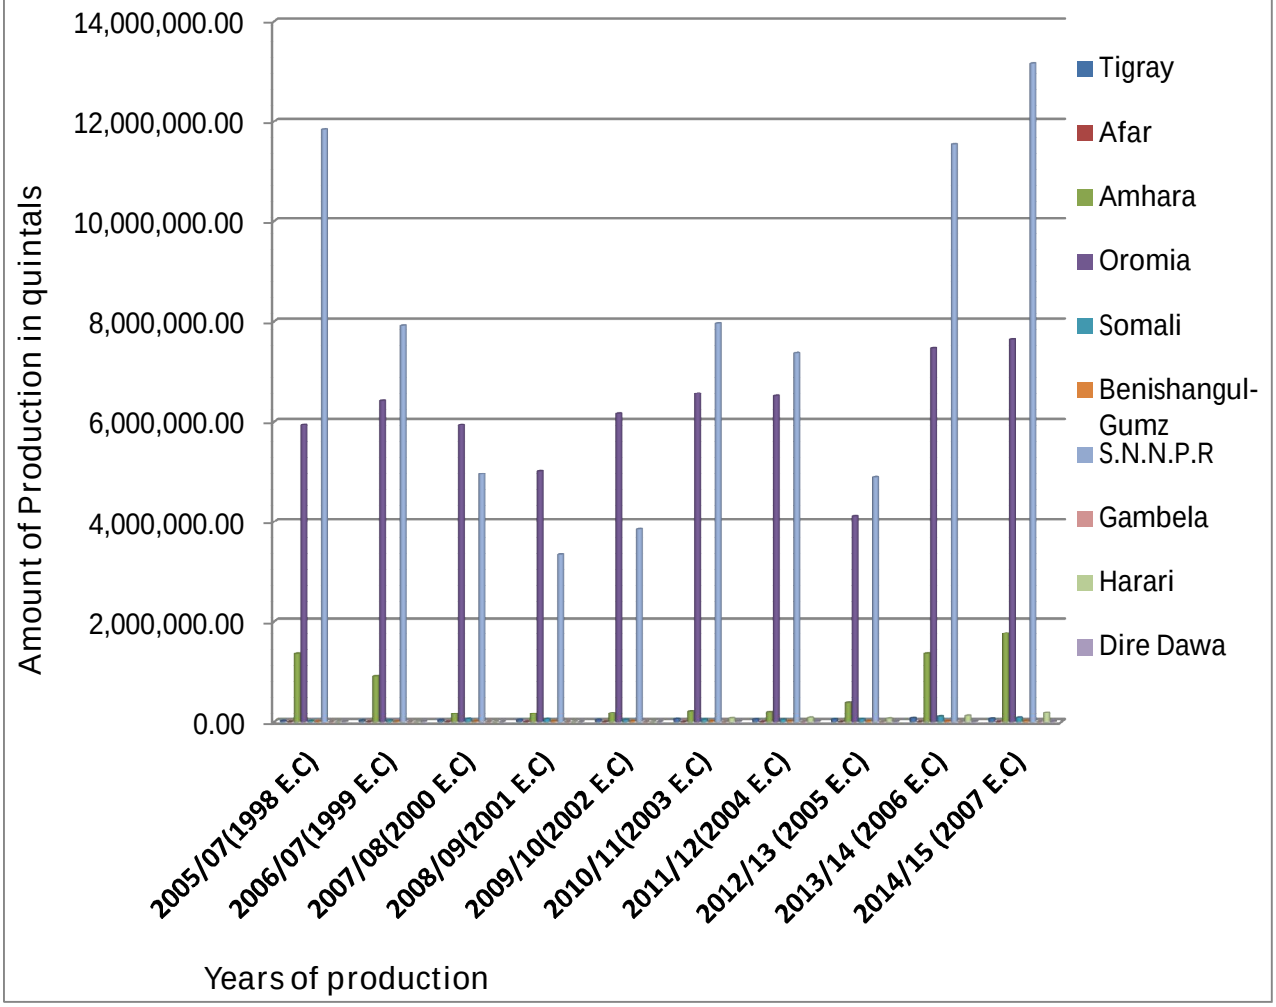
Fig 14: The Status of Root crops amount of production of private peasant holdings during main season from 2005/06 (1998 E.C) to 2014/15 (2007 E.C)



3.2.5. Cash crops

The amount of Cash crop production was decreased at increasing rate from the year of 2005/06 (1998 E.C) to 2008/09 (2001 E.C) and it starts increasing up to 2014/15(2007 E.C) in SNNP, Oromia and Amhara regions. In general, the cash crop production of Ethiopia is mainly comes from SNNP and Oromia region. Most of the Cash crops growing in Ethiopia are namely, coffee, chat, sugarcane & Hops.

Fig 15: The Status of Cash crops amount of production of private peasant holdings during main season from 2005/06 (1998 E.C) to 2014/15 (2007 E.C)



3.3. Trends of major Grain crops productivity across the regional states

3.3.1. Cereal crops

Crop productivity is a key measurement for one nation's agricultural farm growth. Nations are devoted to enhance small holding farmer's crop productivity to achieve its expected level. As a result, cereal crop productivities of Ethiopian private peasant holdings are also increased during the last ten years. The annual agricultural sample survey of CSA shows that, the growth of productivity is not significantly varies across each regional states of Ethiopia during the last ten production period. However, cereal crop productivity is significantly increased within the region from 2005/06 to 2014/15. The four major cereal

crops i.e. Teff, Wheat, Maize & Sorghum productivity changes per annual shows a significant positive change in Tigray, Amhara, Oromia & SNNP regions. The annual average cereal crop productivity growth rate was: Teff 5.89%, 5.88%, 5.49% & 7.29%, Wheat 4.39%, 5.64%, 5.97% & 5.59%, Maize 7.47%, 6.11%, 7.69% & 6.96%, and Sorghum 6.26%, 3.88%, 6.47% & 9.56 percent in Tigray, Amhara, Oromia and SNNP regions respectively. As it indicated in fig 11 below, the major cereal crop productivity growth in the last ten year was highly remarkable. However, it still in low level as compared to the other developing countries.

Fig 16: Major creal crops productivity per hectar of private peasant holding in Ethiopia

3.3.2. Pulse crops

There is no significant pulse crop productivity variation among private peasant holding across the regional states of Ethiopia. But, the pulse crop productivity growth rate is varies across the regions. The average pulse crop productivity growth rate of four major crops like Faba beans, Field peas, Lentils and Chick peas are high in SNNP region and followed by Oromia & Amhara regions during the last ten production period. Despite the pulse crop productivity variation, the growth rate of productivity is significantly increased within each region during the same period. The four major pulse crops i.e. Faba beans, Field peas, Lentils & Chick peas productivity changes per annual shows a significant positive change in Tigray, Amhara, Oromia & SNNP regions. The annual average cereal crop productivity growth was: Fababeans 4.77%, 5.50%, 6.46% & 7.30%, Field peas 4.02%, 6.58%, 6.57% & 7.94%, Lentils 6.27%, 10.16%, 10.25% & 14.97%, and Chick peas 6.94%, 9.30%, 9.02% & 14.73 percent in Tigray, Amhara, Oromia and SNNP regions respectively. Lentils productivity is the most productivity growth in the last ten years in all four regions of Ethiopia.

3.3.3. Oil seeds

There is a small variation in Oil seed crop productivity among private peasant holding across the regional states of Ethiopia. However, the Oil seed productivity growth rate shows a high varies across the regions. The average Oil seed crop productivity growth rate of three major crops like Neug, Linseed and Sesame are high in Tigray region and followed by Oromia during the last ten production period. Despite the Oil seed crop productivity high variation across the region, the growth rate of productivity is significantly increased within each region except for Linseed in Amhara during the same period. The three major Oil seed crops i.e. Neug, Linseed & Sesame productivity changes

per annual shows a significant positive change in Tigray, Amhara & Oromia regions. The annual average Oil seed crop productivity growth rate was: Neug 11.12%, 8.61% & 4.81% Linseed 12%, -8.45% & 9.36% and Sesame 0.01%, 5.62% & -1.04% in Tigray, Amhara and Oromia regions respectively. Sesame crop productivity shows the list productivity growth among the other oil seed crops in the last ten years in all three major oilseed growing regions of Ethiopia. (See fig 13)

Fig 18: Major Oil seed crops productivity per units of hectar in major Oil seed producing reginal states of Ethiopia
