PREFACE

This report presents the 2007 and 2008 Annual Agricultural Survey results. The annual agriculture survey is a continuous program of household surveys carried out by Statistics Botswana formally called Central Statistics Office (CSO) in the Ministry of Finance and Development Planning, through Agricultural Statistics Unit (ASU), in conjunction with the Division of Policy Research and Statistics in the Ministry of Agriculture (MoA). The program is aimed at providing time series data on agricultural sector production indicators and other relevant statistics. It is also aimed at formulating and reviewing of Agricultural policies, programmes and projects geared at improving the lives of Batswana.

I wish to acknowledge all those who contributed to the completion of these two surveys, the farming community for their invaluable time and patience during data collection and any other parties who contributed in one way or the other. The Agricultural Statistics Unit staff is highly commended for the success of the exercise within the limited resources during the collection, processing of the data and production of the report.

It is hoped that the data will be useful in formulating and reviewing policies, programmes and projects in order to improve the performance of the agricultural sector, and eventually better the lives of Batswana.

The Statistics Botswana is currently undergoing a transition to transform the Office into an autonomous Body. This process is aimed to improve the quality, timeliness and integrity of official statistics in the Botswana. The agriculture statistics timeliness and quality are therefore being addressed through the process.

A. N. Majelantle

Acting Statistician General

May 2012

LIST OF AGRONYMS

ALDEP – Arable Land Development Policy

ASU – Agriculture Statistics Unit

CSO – Central Statistics Unit

EER – Establishment and Enterprise Register

CSPro – Census and Surveys Processing System

DPRS – Division of Policy Research and Statistics

GDP – Gross Domestic Product

IMPS – Integrated Microcomputer System

MFDP – Ministry of Finance and Development Planning

MoA – Ministry of Agriculture

NAMPAADD – National Master Plan for Arable Agriculture and Dairy Development

SLOCA – Services to Livestock Owners in Communal Areas

TGLP – Tribal Grazing Land Policy

LIMID – Livestock Management and Infrastructure Development

ISPAAD – Integrated Support Programme for Arable Agriculture Development

'0' **Denotes a number too small to be rounded**
'-' **Not Applicable**
'( )' **Denotes a negative number**

CHAPTER 1 BACKGROUND

The agriculture sector in Botswana, like in many countries, plays an important role in providing food, income, employment and investment opportunities for majority of people, particularly the rural community. The sector's contribution to the Gross Domestic (GDP) has decreased over the years from an impressive 40 percent at independence (1966) to 2.0 percent in 2007 and further to 1.8 percent in 2008 (CSO, Quarterly National Accounts Report, 2009). However, the livestock sub sector contribution to the economy through foreign earnings has been significant; that is, between 2007 and 2008, meat and meat products, hides and skin exports accounted for 2.4 and 2.0 percent of the country's exports respectively (CSO, External Trade Annual Report 2007- 8).

The need for rural development in an effort to improve the agricultural productivity despite the sector's performance, particularly the arable sector, cannot be overemphasized, given the fact that the majority of the country's population in the rural areas derives its livelihood from agriculture as alluded above.

It is against this background that government has adopted strategies and a number of agricultural programmes and policies to promote agricultural productivity. Such programmes include, NAMPAADD, LIMID and the recent ISPAAD to mention a few, all formulated and implemented to improve agricultural production.

It is hoped that the continued government interventions which are aimed at improving the performance of the sector, particularly the arable sub sector, will, however, reduce the dependence on cereal exports as the country is still a net importer of cereals.

CHAPTER 2 ANALYSIS OF THE RESULTS

2.1 Agricultural Holders (Farmers) Characteristics

This report presents the 2007 and 2008 Annual Agricultural Surveys results. Unless otherwise stated, the discussions will be based mostly on the traditional sector because of its dominance in the agricultural sector. It should also be noted that the percentages quoted in this report do not form part of the referenced tables.

The results indicate that between 2007 and 2008 agricultural seasons, the number of farmers participating in agricultural activities has made a significant difference particularly under the traditional sector; that is, the number of farmers rose from 111,322 in 2007 to 130,800 in 2008, representing a 17.5 percent increase at national level **(**Table 2.2a).

The dominance of the male agricultural farmers under the traditional sector is observed and it constitutes 58.6 and 59.1 percent respectively between 2007 and 2008 as compared to their female counterparts (Table 3.1).

With respect to marital status, the results show that there are more farmers within the 'never married' category constituting 44.2 percent in 2007 and 44.6 percent in 2008, followed by those in the 'living together' (25.8 and 24.6 percent in 2007 and 2008 respectively) category. Most of the never married farmers are males (42.4 and 42.2 percent in 2007 and 2008 respectively) while the living together farmers are mostly females (21.6 and 21.0 percent in 2007 and 2008 respectively). The number of farmers within the 'married' category accounts for 18.8 percent and 19.0 percent in 2007 and in 2008 agricultural seasons respectively. (Tables 3.2 – 3.4). The 2006 annual agricultural survey results also depict the same pattern.

The engagement of the youth in farming activities is less pronounced, particularly in the age group 12-19 years and thus improves as age increases. It is further observed that the average age of a farmer is 59 and 69 years in 2007 and 2008 agricultural seasons respectively irrespective of sex (Table 3.5). The 2007 average age of a farmer compares well with that of 2006 (58 years).

Farmers are also engaged in other economic activities such as selling traditional beer and running a trading store/shop/vendor, to mention a few, and these rated higher than others. Farmers running a store/shop/vendor increased from 8,427 in 2007 to 9,140 in 2008 while those selling traditional beer increased from 4,391 to 4,749 during the same period (Table 3.10).

While there are a number of sources of income for farmers, 'income from a paid employment' and 'pensions' are noted as the main sources during the 2007 and 2008 agricultural seasons. Income from paid employment accounted for 28.3 percent and 26.1 percent, while pensions accounted for 21.7percent in 2007 to a high of 27.4 percent in 2008 (it was the highest contributor), an increase of 26.3 percent during the same periods. However, sale of crops rated very low at 0.9 percent in 2008 from 2.5 percent in 2007 (Table 3.16B).

The dependence on 'purchased food' as opposed to 'own farm produce' is higher among the farming community, contributing 90.1 percent in 2007 and 83.1 percent in 2008; a significant decrease of 7.7 percent. However, 'own farm produce' shows a significant increase, from 2.5 percent in 2007 to 7.0 percent in 2008. This may explain the reduction in dependence on 'purchased food' above during the periods under consideration. Obtaining food through 'Government rations' also increased from 6.3 percent in 2007 to 9.3 percent in 2008 (Table 3.17B).

Although agricultural activities are labour intensive, the results suggest a low proportion of engagement of farm workers under the traditional sector, which accounts for 16.9 and 15.6 percent in 2007 and 2008 respectively as opposed to 18.8 percent in 2006 (Table 3.18). The majority of these farm workers are Batswana, accounting for 89.0 and 83.3 percent during the period under consideration (Table 3.20) and are mostly engaged on permanent basis (Table 3.23). Moreover, the average earning of a farm worker is P417.00 for 2007 and P525 for 2008, a significant increase of 20.6 percent (Average earnings for the commercial sector are P426 and P499 for 2007 and 2008 respectively).

2.2 Livestock Statistics

Livestock statistics comprise of cattle, goats, sheep, donkeys/mules, horses, pigs, ostriches, chicken and others, but this summary will only concentrate on the three major ones, namely, cattle, goats and sheep.

Table 2.2a shows livestock holdings, population and production indicators from 2006 and 2008.

Table 2.2a: Livestock Holdings, Population and Indicators from 2006 to 2008

% Sheep Holdings	15.2	35.0	15.3	16.0	31.5	16.1	15.8	34.0	16.0

NB: Trad - Traditional and Comm-Commercial

Generally, the engagement of farmers in cattle, goats and sheep farming has been stable at national level between 2006 and 2008, constituting about 60 percent, 70 percent and 16 percent of the total agricultural activities respectively (Table 2.2a).

The 2007 and 2008 annual agricultural survey results indicate that majority of livestock ownership for different types of livestock under the traditional sector is skewed towards male headed farmers when compared to their female counterparts. In 2007 male headed farmers stood at 69.6, 60,7 and 71.6 percent for cattle, goats and sheep respectively (Tables 4.1 for cattle, 5.1A for goats and 5.8A for sheep). The same pattern was observed in 2008 (70.6, 61.0 and 70.3 percent).

Engagement of farmers in pastoral farming (be it cattle, goats or sheep) gets more pronounced as they grow older and this is mostly concentrated in farmers aged 65 years and above. Male farmers dominate in this age group as opposed to their female counterparts in all types of livestock (Tables 4.1C for cattle, 5.1C for goats and 5.8C for sheep), and so is the number of livestock owned.

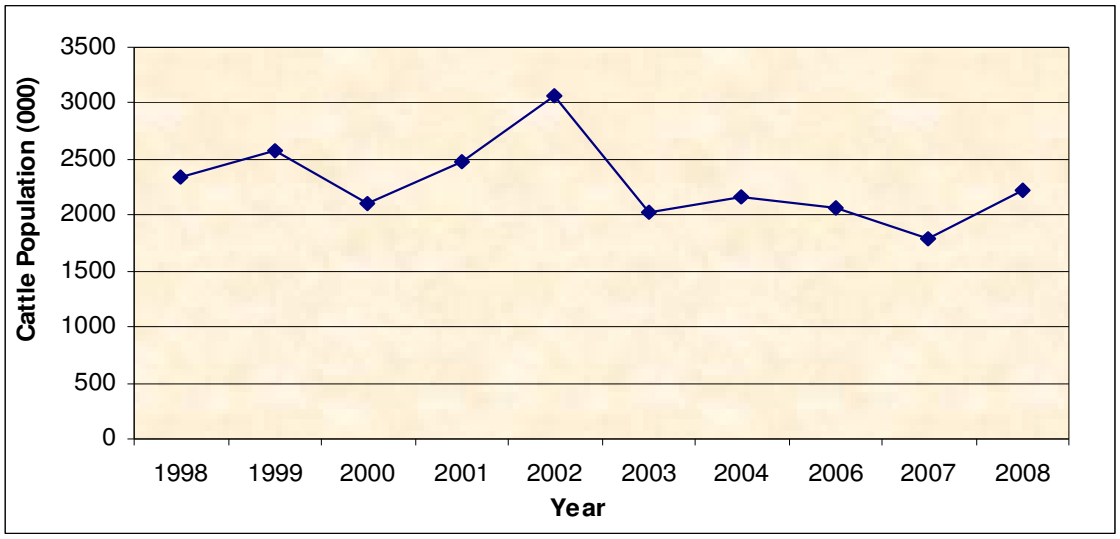
2.2.1 Cattle

There has been a significant increase of 14.3 percent in cattle holdings from 66,410 in 2007 to 75,937 in 2008 at national level. This represented 59.7 and 59.1 percent of the total agricultural holders respectively during the same period (Tables 2.2a).

Cattle population increased significantly by 24.1 percent from 1.788 million in 2007 to 2.220 million in 2008. In all the years, the traditional sector dominated the cattle industry constituting over 90.0 percent of the cattle population.

Figure 2.2.1 shows cattle population trend from 1998 to 2008. The trend depicts a constant pattern ranging between 2.0 and 2.5 million except in 2002, where the population rose to about 3.0 million, and was lower in 2007 at about 1.8 million.

Figure 2.2.1: Cattle Population Trends from 1998 to 2008



There have been significant differences in cattle mortality rates from 2006 to 2008 agricultural seasons. This rate was 9.5 percent in 2006, went down to 8.1 percent in 2007 and further to 5.8 in 2008 at national level. Under the traditional sector, mortality decreased from 8.5 percent in 2007 to 6.0 percent in 2008 while under commercial sector the rate remained constant at around 4.0 percent during the same periods (Table 2.2a).

Cattle off-take rates[1] from the 2006 to 2008 agricultural seasons show significant variations. That is, the rate has significantly gone up to 9.4 percent in 2007 from 7.9 percent in 2006 and went down to 8.1 in 2008 at national level. The commercial sector showed higher rates of 18.2 and 12.9 percent respectively during the same periods (Table 2.2a).

[1] *Off-take is sales + home slaughter – purchases and off-take rate is the proportion of off-take to the total livestock population (cattle, goats and sheep)*

Cattle birth rate went down to 46.7 percent in 2008 from 59.7 percent in 2007 at national level. A graphical presentation of cattle production indicators trends from 1998 to 2008 for the traditional sector is given as Figure 2.2.1A

Figure 2.2.1A: Traditional Sector: Cattle Production Indicators Trend from 1998 to 2008.

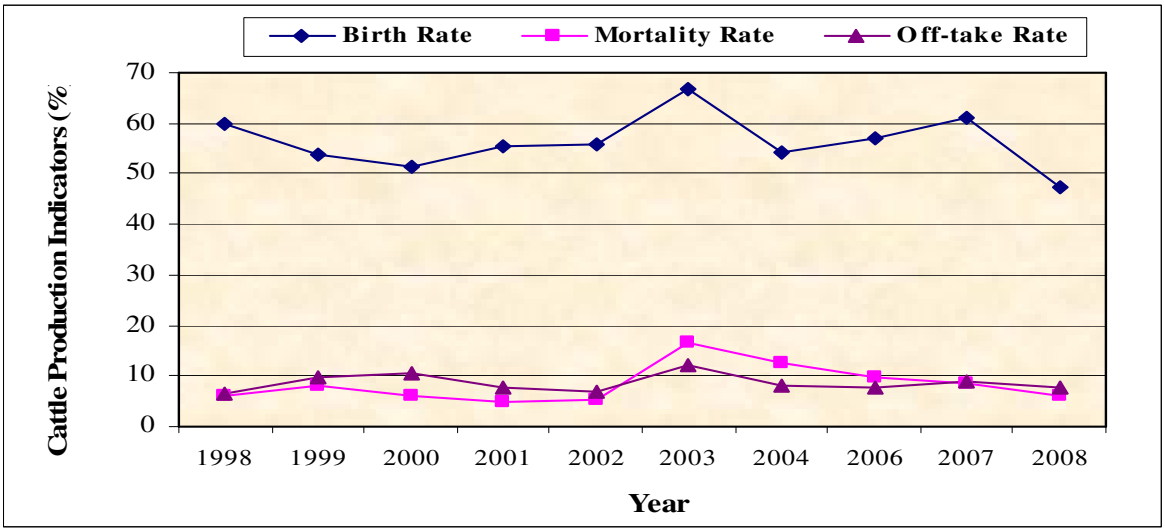


Figure 2.2.1A suggests constant birth rates ranging between 50 and 60 percent except in 2003 (66.6 percent) and 2008 (47.3 percent) while off take and mortality rates had barely gone beyond 10 percent except in 2003 and 2004 agricultural seasons.

2.2.2 Goats

Farmers rearing goats increased by 17.8 percent between 2007 and 2008 agricultural seasons; from 77,394 in 2007 to 91,172 in 2008 at national level. This represented 69.5 and 69.7 percent of the total agricultural holders respectively (Table 2.2a). Similarly goats' population increased by 14.5 percent; from 1.640 million to 1.879 million during the same period. In all these seasons the traditional sector dominated as shown in Table 2.2a

Figure 2.2.2: Goats Population (000) Trend from 1998 to 2008

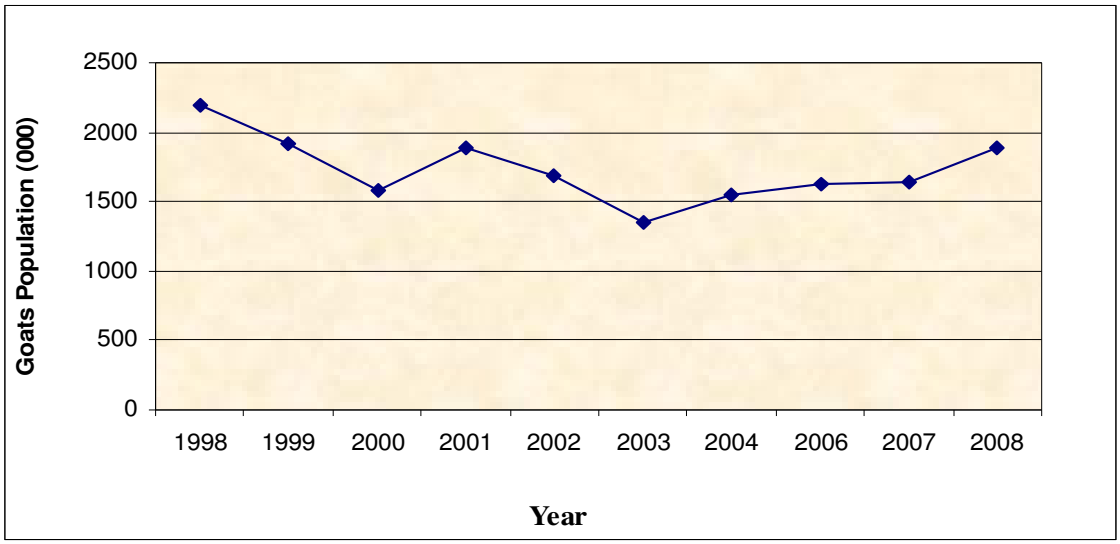

Figure 2.2.2 shows goats' population trend from 1998 to 2008. The graph depicts a downward trend with some improvements since 2004.

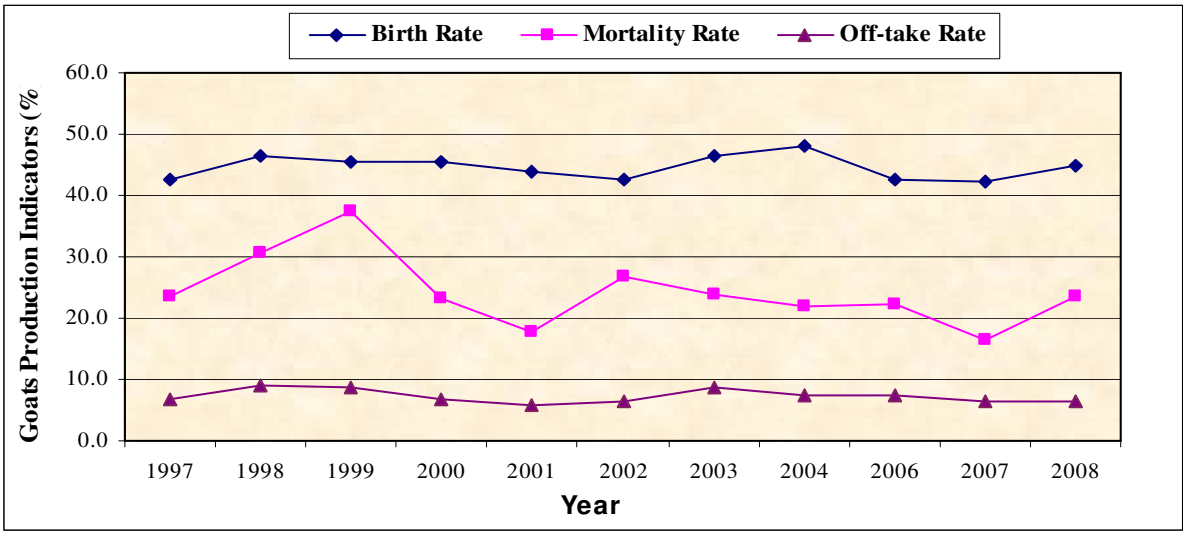
A graphical presentation of goats' production indicators trends from 1998 to 2008 is given as Figure 2.2.2A. The figure shows stable goats' birth rates ranging between 40 and 50 percent while offtake rates are below 10.0 percent. Death rates ranged between 10.0 and 20.0 percent except in 1999 (28.0 percent), 2001 (17.7 percent) and 2007 (16.3 percent).

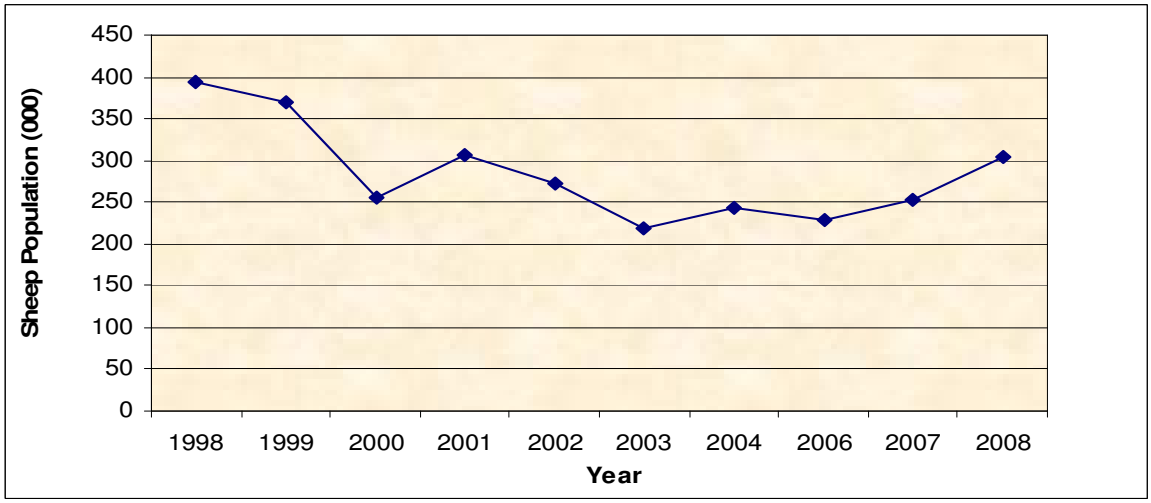
Figure 2.2.2A: Traditional Sector: Goats Production Indicators Trend from 1998 to 2008.



2.2.3 Sheep

There has been an increase in the number of farmers rearing sheep between 2007 and 2008 agricultural seasons; from 17,890 to 20,864, a 16.6 percent increase at national level as shown from Table 2.2a. This represented 16.1 and 16.0 percent of the total agricultural holders respectively. Sheep population significantly increased by 19.9 percent; from 252,992 to 303,238 during the period under consideration (Table 2.2a).

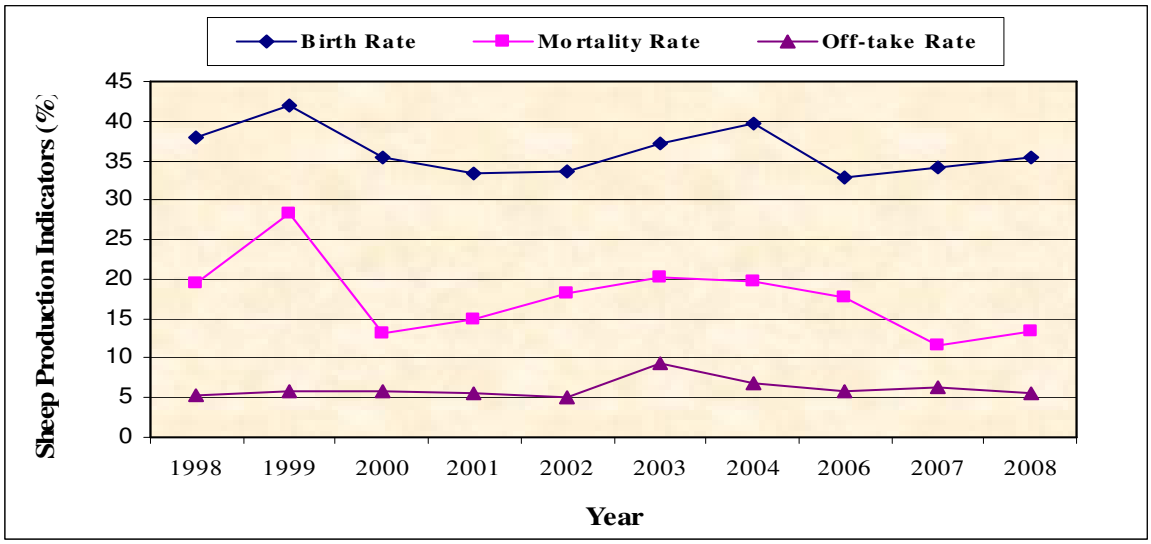
Figure 2.2.3: Sheep Population (000) Trend from 1998 to 2008



The production indicators (birth, death and off-take rates) show a slightly upward trend, (except for offtake rates) of 34.1 percent, 12.6 percent and 6.1 percent respectively in 2007 season when compared to 35.0 percent, 13.4 percent and 5.7 percent in 2008 at national level (Tables 2.2.a). In 2007 mortality was quite high for the commercial sector when compared to 2006 season figure and improved in the year 2008.

Figure 2.2.3A shows sheep population trend from 1998 to 2008. The figure indicates a downward and fluctuating trend with some improvements realized from the 2007 agricultural season.

Figure 2.2.3A: Traditional Sector: Sheep Production Indicators Trend from 1998 to 2008.



The figure further shows that birth rates have remained between 30 and 40 percent except in 1999 (41.9); death rates remained between 10 and 20 percent except in 1999 (28.3); while offtake rates remained below 10 percent during the 10 year period.

2.3 Crop Statistics

This section gives a summary of crop statistics for 2007 and 2008 cropping seasons. Crops covered include sorghum, maize, millet, beans/pulses, sunflower, groundnuts and others. However, the discussions will concentrate on four major crops namely sorghum, maize, millet and beans/pulses.

2.3.1 Total Holdings, Total Area Planted and Harvested

Table 2.3.1 presents total land holdings and land area, total crop holdings and area planted, total holdings harvested and total area harvested for 2006, 2007 and 2008 agricultural seasons.

Table 2.3.1: Total Holdings, Area Planted and Harvested from 2006 to 2008

Indicators	2006			2007			2008		
	Trad	**Comm**	**Total**	**Trad**	**Comm**	**Total**	**Trad**	**Comm**	**Total**
Land Holdings	65,841	55	65,896	59,714	47	59,761	77,148	111	77,259
Holdings Planted	63,594	46	63,640	41,113	35	41,148	74,351	69	74,420
Holdings Harvested	57,149	40	57,189	10,860	29	10,889	48,697	58	48,755
Total Land Area (ha)	191,423	9,372	200,795	174,966	7,168	182,134	219,866	59,043	278,909
Total Area Planted (ha)	173,409	9,067	182,476	102,285	5,967	108,252	203,714	22,807	226,521
Total Area Harvested (ha)	133,039	8,744	141,783	21,322	5,580	26,902	108,515	17,288	125,803
Fallow land Area (ha)	18,014	305	18,319	72,681	1,201	73,882	16,152	36,236	52,388
% Land area not planted	*9.4*	*3.3*	*9.1*	***41.5***	***16.8***	***40.6***	***7.3***	***61.4***	***18.8***

The table indicates that the number of farmers with land for planting (land holdings) significantly increased by 29.3 percent; from 59,761 in 2007 to 77,259 in 2008. Total land area[2] also increased significantly by 53.1 percent; from 182,134 hectares to 278,909 hectares during the same period. It is also noted that fallow land area (land not planted) reduced from 40.6 percent in 2007 to 18.8 percent in 2008. A high percentage of fallow land area (41.5 percent) is noted under the traditional during

[2] *Land area refers to area planted + fallow land area. Fallow land is land not ploughed during the survey season but was ploughed during the past year(s). For a piece of land to be regarded as fallow it has to stay at most five years without being ploughed. However, this differs from one region to the other. Land area may also increase or decrease depending on the extent of its utilization in a given agricultural season.*

the 2007 cropping season and was high under the commercial sector (61.4 percent) in 2008 cropping season.

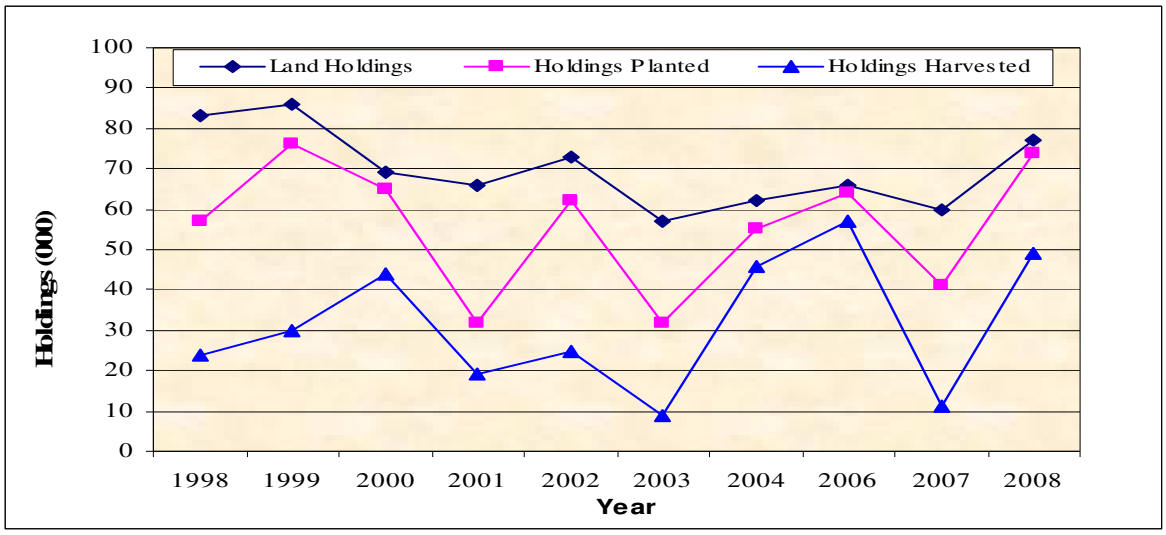
While land holdings and holdings planted show an upward trend between 2006 and 2008 (though estimates for the 2007 cropping season are lower), holdings and area harvested depict a downward trend (Table 2.3.1).

Area planted increased by over a fold between 2007 and 2008 cropping seasons; from 108,252 hectares in 2007 to 226,521 hectares in 2008 with highly significant increases in area planted under the commercial sector. However, a small proportion of farmers of about 26.5 percent in 2007 harvested some crops as opposed to 65.5 percent in 2008. In all cases, the 2006 figures were generally higher than those of 2007 but lower than the 2008 figures except for holdings and area harvested (Table 2.3.1).

It should however, be noted that 2007 cropping season was a drought year (Drought and Household Food security Outlook, 2008) and might have had impacted negatively on cropping activities of the same year, while the ISPAAD program, which started in 2008, might have had a positive impact on the highly significant increases in holdings and area planted realized during the year.

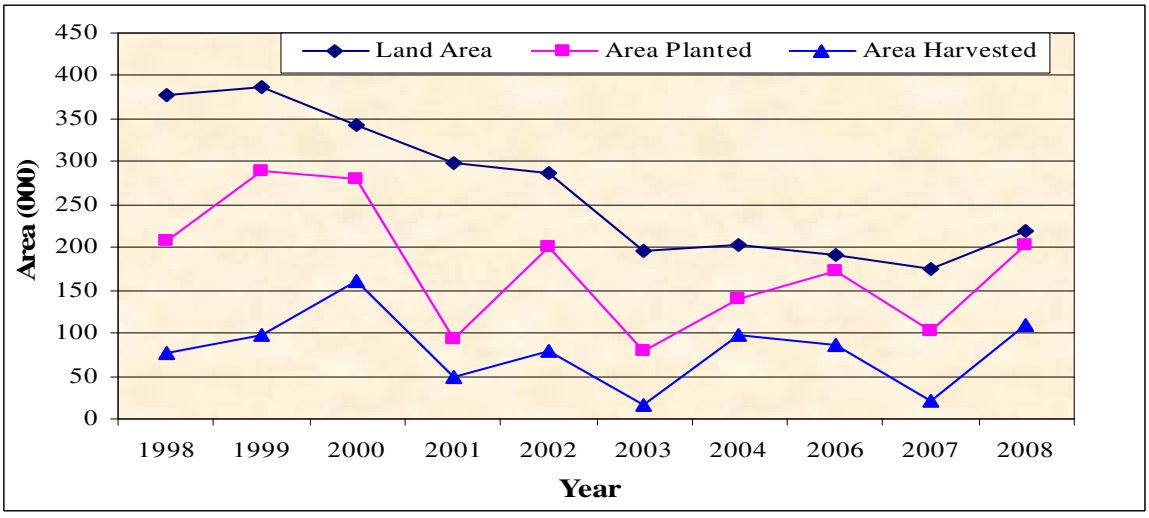
A graphical presentation of land holdings, holdings planted and holdings harvested trend from 1998 to 2008 for the traditional sector is given as Figure 2.3.1A while land area, area planted and harvested trend is presented as Figure 2.3.1B.

Figure 2.3.1A: Land Holdings, Holdings Planted and Harvested from 1998 to 2008



Figures 2.3.1A and 2.3.1B show ten year trends of land holdings, holdings planted and holdings harvested against area planted, area harvested and production since 1998. The trends are generally going down. Specifically, Figure 2.3.1A suggests a downward trend on land holdings, and with some fluctuations observed on holdings planted and harvested. A similar pattern is noted on Figure 2.3.1B for area planted and harvested during the ten year period. There are however, improvements on these indicators in 2008.

Figure 2.3.1B: Land Area, Area Planted and Harvested from 1997 to 2008



2.3.2 Crops Planted and Harvested

Comparisons of results between 2007 and 2008 agricultural seasons in Table 2.3.2 and Figure 2.3.2 suggest that a larger proportion of area planted is covered by maize and sorghum while millet and pulses cover a smaller proportion at national level (30.6, 37.6, 5.5 and 17.2 percent respectively in 2007 as opposed to 32.3, 39.1, 5.0 and 13.0 percent in 2008). The area planted is highest for maize (39.4 percent) under the traditional sector and highest for sorghum (52.6 percent) under commercial sector in 2007 as opposed to 43.4 and 43.5 percent respectively in 2008. The same pattern is observed for area harvested.

Table 2.3.2 further suggests that though large area is planted for the four major crops, particularly sorghum and maize, proportions harvested are generally low at national level. Proportions were below 40.0 percent in 2007 and above 55.0 percent except for pulses in 2008. This discrepancy is more pronounced under the traditional sector as opposed to the commercial sector (above 70.0 percent during the period under consideration).

The pie charts in Figure 2.3.2 show proportions of area planted, area harvested and production for four major crops being sorghum, maize, millet, beans/pulses and 'others' during the two agricultural seasons under traditional sector only. The charts suggest that traditional farmers resort to planting maize more than sorghum.

Furthermore, production is usually lower under the traditional sector despite large area planted. However, 2008 estimates show improvements, hence better yields. It should be noted that 'other crops' include sweet reeds, watermelons, melons, pumpkins, sunflower and ground nuts. It should also be noted that a high production under 'other' is accounted for by watermelons.

Table 2.3.2: Four Crops: Area Planted, Harvested, Production and Yields; 2007 and 2008

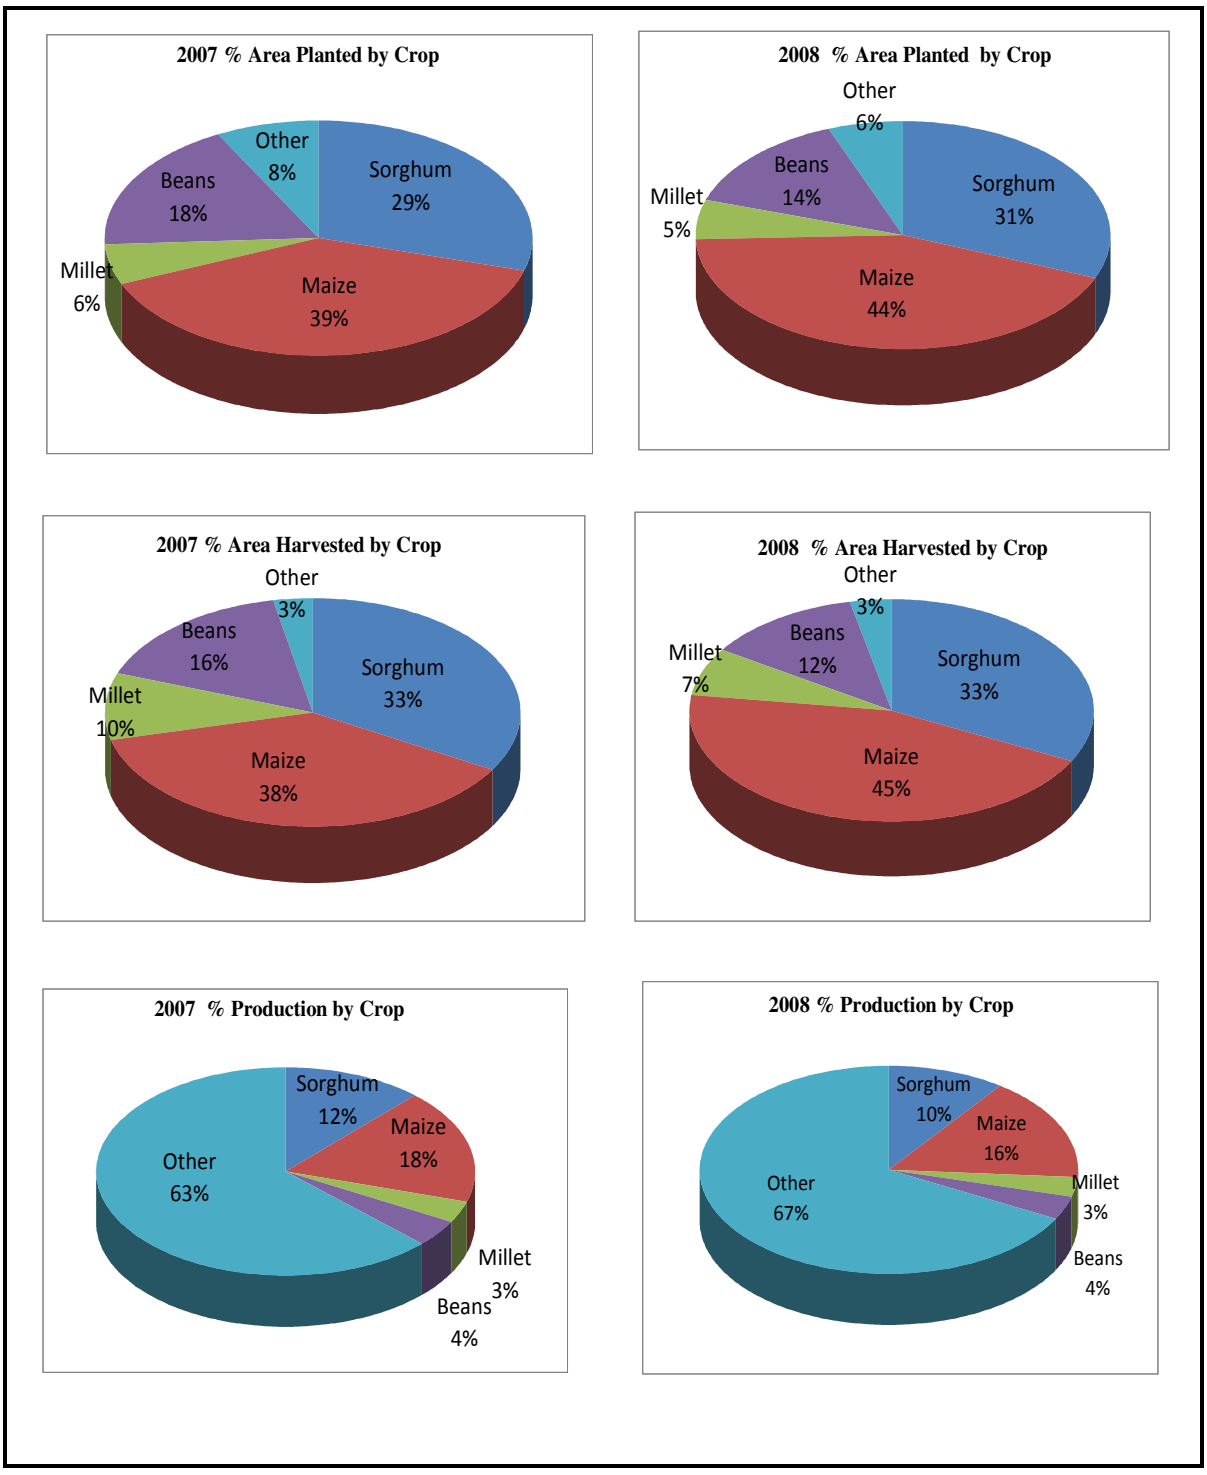
Figure 2.3.2: Area Planted, Area Harvested and Production for 2007 and 2008 – Traditional Sector



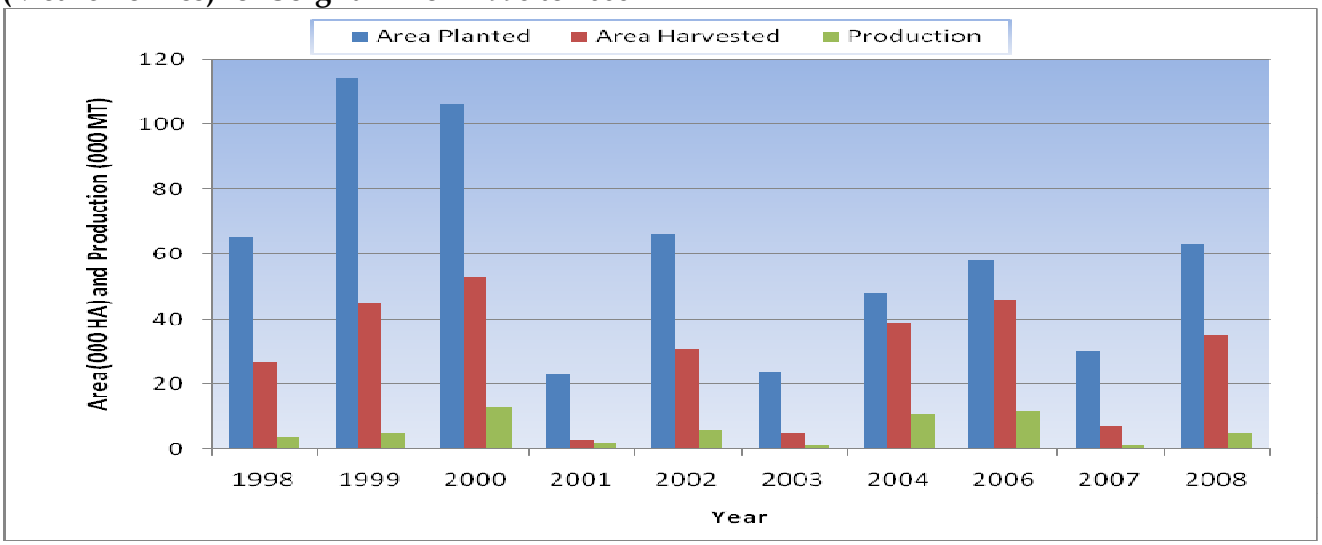
2.3.2.1 Sorghum

The number of farmers who planted sorghum rose from 26,976 in 2007 to 47,993 in 2008, a 77.9 percent increase at national level. Area planted increased by over a fold from 33,115 hectares to 73,156 hectares between the two agricultural seasons. This translates to 30.6 percent of the total area planted in 2007 and the coverage rose to 32.3 percent in 2008. Of the area planted (for sorghum), only 30.3 percent was harvested in 2007 and this rose to 58.7 percent in 2008 at national level (Table 2.3.2).

Area harvested for sorghum also rose significantly by over three folds; from 10,027 hectares to 42,914 hectares between the two agricultural seasons. This constitutes 37.3 percent of the total area harvested in 2007 as opposed to 34.1 percent in 2008 (Table 2.3.2). Total production also increased from 11,774 metric tonnes in 2007 to 23,633 metric tonnes in 2008 at national level. Conversely, yield per hectare planted dropped from 356kg/ha to 323 kg/ha during the same period. However, high significance increases of these indicators are realized under the commercial sector.

Figure 2.3.2.1 show area planted, harvested and production trends for sorghum from 1998 to 2008 and shows low estimates in 2001, 2003 and 2007.

Figure 2.3.2.1: Traditional Sector: Area planted and Harvested (Hectares) and Production (Metric Tonnes) for Sorghum from 1998 to 2008



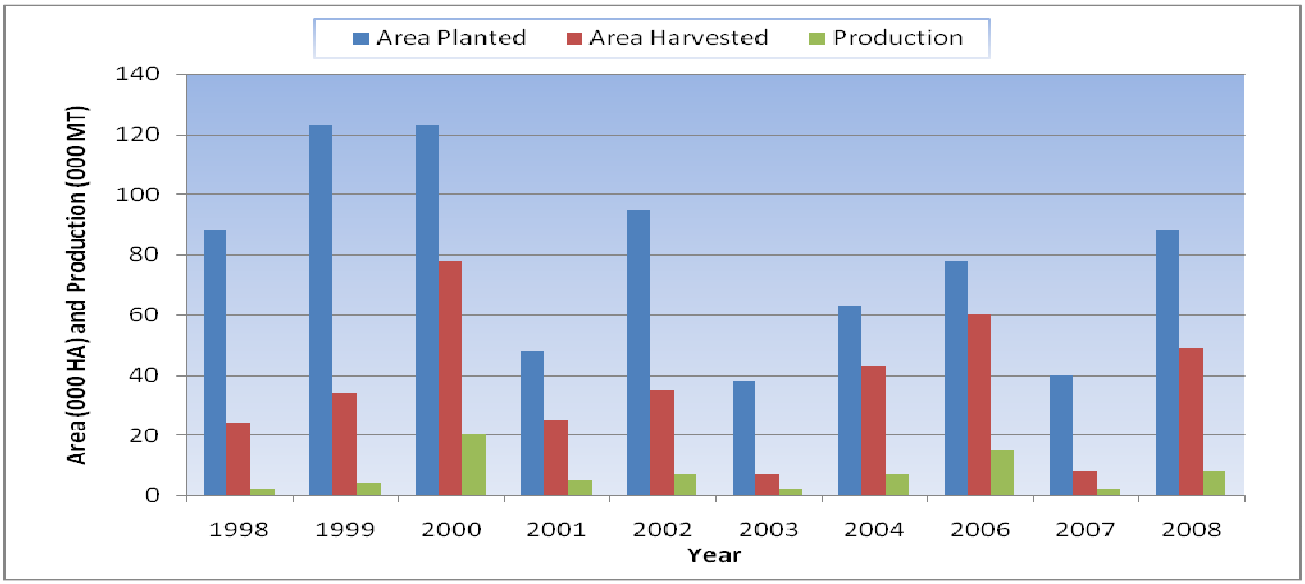
2.3.2.2 Maize

It is evident from Table 2.3.2 that farmers who planted maize rose by 86.9 percent; from 37,610 in 2007 to 70,276 in 2008. Area planted under maize more than doubled between 2007 and 2008; from 40,675 to 88,613 hectares at national level. Out of this area planted only 20.8 percent was harvested in 2007 while 54.9 percent was harvested in 2008.

During the 2007 agricultural season, 37.6 percent of the planted area was covered by maize while in 2008 the area rose to 39.1 percent at national level. Area harvested for maize (8,452 hectares) constituted 31.4 percent of the total area harvested (26,902 hectares) in 2007, giving a total production of 2,158 Metric tonnes. In 2008 the coverage rose to 38.7 percent with a total production of 48,663 Metric tonnes at national level. However, high significance increases of these indicators are realized under the traditional sector. Yields also increased during the same period.

A graphical presentation of Area Planted, Area Harvested and Total Production Trends from 1998 to 2008 for the traditional sector is given as Figure 2.3.2.2. The figure reflects low production estimates except in 2000 and 2006 seasons.

Figure 2.3.2.2: Traditional Sector - Maize: Area Planted, Area Harvested and Total Production from 1998 to 2008

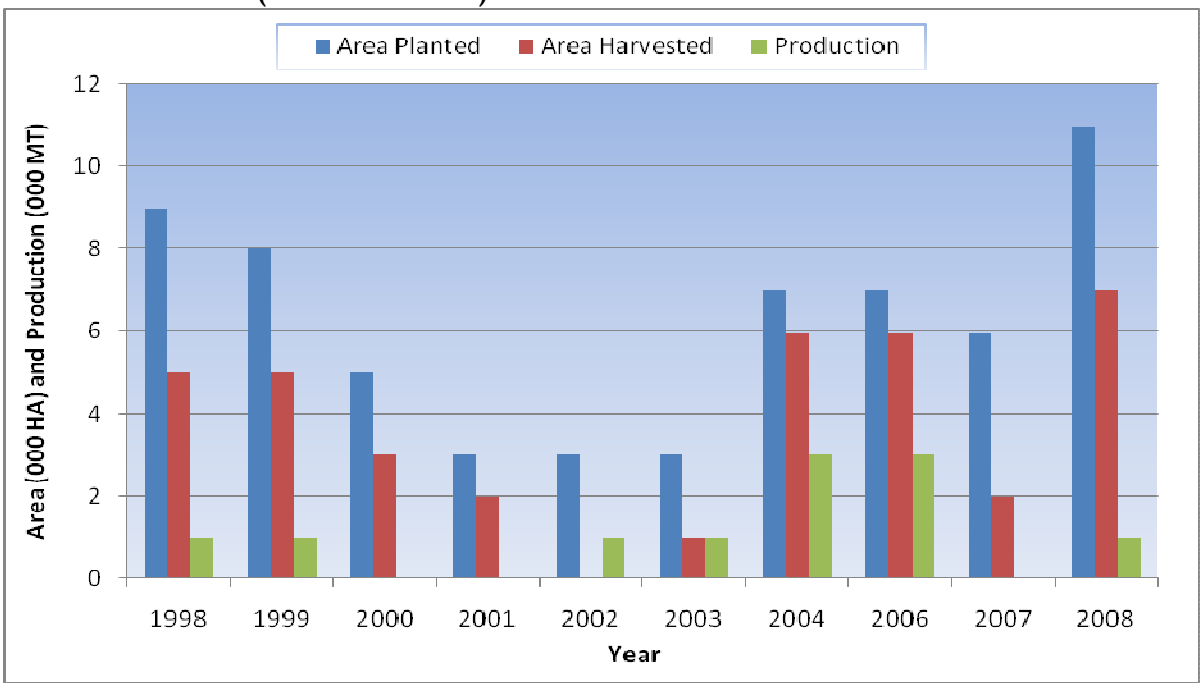


2.3.2.3 Millet

In 2007 a total of 12,717 farmers planted 5,939 hectares of millet. Out of the planted area, 39.2 percent was harvested, producing 532 Metric tonnes at national level. An increase is noted in 2008 where area planted was 11,347 hectares from 5,939 hectares in 2007 yielding production of 1,637 Metric tonnes. Of the millet planted area, 67.4 percent was harvested (Table 2.3.2). An increase in millet production is realized under the traditional sector as opposed to reductions under the commercial sector. Yield per hectare planted also rose from 90 kg/ha in 2007 to 144 kg/ha in 2008.

A graphical presentation of area planted, area harvested and Total Production Trends from 1998 to 2008 is given as Figure 2.3.2.3 for the Traditional sector only. The figure depicts high production in 2004 and 2006 while area planted and harvested were highest in 2008.

Figure 2.3.2.3: Traditional Sector-Millet: Area Planted, Area Harvested (HA), and Total Production (Metric Tonnes) from 1998 to 2008



2.3.2.4 Beans/Pulses

Table 2.3.2 shows that in 2007, farmers who planted beans/pulses significantly increased by 87.1 percent; from 35,610 in 2007 to 66,609 in 2008 out of which 20.1 and 47.2 percent respectively was harvested at national level. Of the total area harvested for beans/pulses, 16.4 and 12.3 percent were for traditional sector while 4.7 and 3.1 percent were for the commercial sector respectively, between 2007 and 2008.

A graphical presentation of Area Planted, Area Harvested and Total Production Trends from 1998 to 2008 is given as Figure 2.3.2.4 for the traditional sector only. The figure suggests high area planted in 1999, high production in 2000 and 2006.

Figure 2.3.2.4: Traditional Sector-Pulses: Area Planted, Area Harvested (HA), and Total Production (Metric Tonnes) Trends from 1998 to 2008

APPENDIX I: SURVEY DESIGN

1.1 Objective of Annual Agricultural Surveys

The 2007 and 2008 annual agricultural surveys are a component of a continuous program of household surveys, which is specific to the agricultural sector aimed at establishing trends in agricultural production and mode of operation. The main objective of the program is to provide time series of basic information on *crop* production and livestock population and on related general agricultural data. The information is mainly used to develop, review, monitor and evaluate agricultural policies, programs and projects targeted towards improving the farming community, as well as the public and other users for investment purposes.

1.2 Coverage

The program covered the following sub-components:

- The Traditional/Subsistence Sector.
- The Commercial Sector.

(a) The Traditional/Subsistence Sector

The Traditional or subsistence sector covered farmers operating on communal areas and their produce is mainly for subsistence purposes. The data were collected through a questionnaire administered by a team of Technical Assistants. The survey covered agricultural holdings and their principal characteristics such as:

- Characteristics of the holder and other members of the holding (age, sex, etc)
- Land use (crop and fallow land and measurements for such)

- Farming implements and methods of farming.
- Livestock counts and inventory (births, deaths, sales, home consumption, purchases)
- Crop production by type
- Farming practices and enterprise
- Livestock water supply, farm equipment and machinery inventory etc

(b) The Commercial Sector

The commercial sector covered farmers operating on leasehold, freehold or TGLP farms and their produce are for commercial purposes. The data were collected through a mailed questionnaire administered by farmers themselves. Follow-ups were made to those farmers who did not respond to the questionnaire.

The sector covered the same information similar to the one covered under the traditional sector except for additional information on;

- Cash crops such as wheat, pulses, sunflower, groundnuts, cotton, etc.
- Vegetables such as potatoes, tomatoes, onions, cabbage, spinach, carrots etc.
- Fruits such as oranges, naartjies, lemons, grapefruit, bananas, etc.

1.3 Questionnaires

Four different questionnaires (Forms I, II, III & IV) were used for data collection, of which three (Forms I, II, & III) were used for data collection under the traditional sector while Form IV questionnaire was used for data collection under the commercial sector. These questionnaires were administered in phases. The same sets of questionnaires are used during each annual survey with very slight changes where necessary until the next census when major changes can be effected.

1.4 Training of Enumerators

Training of enumerators was done at the beginning of the year, January to refresh them on concepts and to address other problems encountered during data collection. It was also done to harmonize the survey administration so that there was consistency in interpretation of questions and concepts. There were eight (8) teams deployed to cover all the 255 enumeration areas around the country. Each team consisted of five (5) members consisting of three (3) enumerators, a supervisor and a driver.

1.5 Survey Phases and Data Collection

The two annual agricultural surveys were divided into three phases. The first phase and second phase covered traditional sector data collection. The first phase ran from January to June, while the second ran from July to September. The third phase covered commercial sector data. This phase ran from August to December.

(a) Traditional Sector

The traditional sector data collection was carried out during first and second phases of the survey, where a set of questionnaires notably Forms I, II and III were administered by enumerators. During the first phase, dwellings were listed using Form I and agricultural holders identified and sampled. Form II was then administered on the selected agricultural holders. The same holders or farmers were visited during second phase for administration of Form III.

(b) Commercial Sector

The commercial sector data collection was carried out during phase three with administration of Form IV. Unlike in the traditional sector, commercial sector data collection was done through a mailing system. Commercial farmers fill in questionnaires and sent them back to the office. The problem with this kind of data collection is high non response rate. Follow ups were made to reduce the non response rate.

1.6 Data Processing

Data processing involves data coding, data entry, data cleaning and analysis. Data processing for the 2007 and 2008 annual agricultural surveys were done in house. Two software packages were used for data processing, that is, Integrated Micro Computer Processing System (IMPS) and Census and Surveys Processing System (CSPro). Data entry and data cleaning were done using CSPro while data analysis (tabulation) was done using IMPS.

1.7 Response Rate

During 2007 annual agricultural survey, of the 255 enumeration areas (EAs) selected 252 were enumerated while in 2008 the team managed to enumerate 251. In 2007 3,236 agricultural holders were sampled from these EAs, of which 3,133 responded to the questionnaires, yielding a response rate of about 96.8 percent. However, in 2008 2,960 holders were sampled and 2,825 or 95.4 percent of them responded.

APPENDIX II: SURVEY METHODOLOGY

The survey methodology used during the 2004 Agricultural Census was used for these two Annual agricultural surveys since that can only be changed after the next census.

2.1 Target Population

For the traditional sector, the rural areas of Botswana including large villages, which were classified as urban[1] during the 2001 Population and Housing Census, formed a basis for the subsistence agricultural holders.

For the commercial sector, a list of agricultural farms or ranches on freehold land, leasehold land, and Tribal Grazing Policy Land (TGLP) farms formed a basis for the commercial agricultural holders. Thus the target population for the annual agricultural surveys is the traditional and commercial holdings.

2.2 Sampling Frame

There are two different frames used for selecting the samples for the annual agricultural surveys.

2.2.1 Traditional Sector Sampling Frame

The traditional sector sampling frame consists of a list of enumeration areas constructed from the 2001 Housing and Population Census. There were 4,165 enumeration areas demarcated for the 2001 Population and Housing Census, of which 3,112 formed a basis for the 2004 Agriculture Sampling Frame. This was as a result of the exclusion of commercial farms, camps, cities and towns enumeration

[1] *Urban Villages*: These are villages each with a 2001 Census population of 5,000 or more and at least 75 percent of its workforce engaged in non-agricultural economic activities.

areas. A sample of 1,202 enumeration areas were selected during 2004 agricultural census and these formed a basis for the 2007 and 2008 annual agricultural sampling frame, of which 256 enumeration areas were selected. This number was however reduced to 255 as one selected enumeration area was found to have been converted into a TGLP. This number of enumeration areas will be used for all subsequent annual agricultural surveys until the next agricultural census.

2.2.2 Commercial Sector Sampling Frame

A list of freehold, leased and TGLP farms or ranches obtained from the Establishment and Enterprise Register (EER) formed a basis for the commercial sector sampling frame. This was supplemented by a list of commercial farms obtained by enumerators from the Department of Veterinary Services, through its extension service.

2.3 Stratification

The annual agricultural surveys have three levels of stratification. The lowest level comprised of the twenty-six agricultural districts. The second level consists of the six agricultural regions. The third level is the national level. It should be noted that the agricultural districts are not necessarily the same as administrative districts as defined by the Ministry of Local Government. However, these are within the boundaries of administrative districts.

Apart from national and rural estimates, the Government, which is the main user of CSO data, requires accurate estimates for all agricultural districts and regions for planning, review, implement, monitor and evaluate agricultural development policies, programs and projects. Explicit stratification was therefore undertaken such that all agricultural districts become their own strata.

The frame was organized in such a way that there was implicit stratification[2] according to rural ecological zones namely (i) Village (ii) Lands, and (iii) Cattle-post. This implicit stratification along ecological zones was expected to increase precision and improve the accuracy of survey data in view that homogeneity of the variables was relatively high.

During the delineation of the maps, each EA was associated with unique ecological zone and thus, grouping the enumeration areas into respective zones was not a problem. To facilitate the selection according to the stratification variables, the enumeration areas were listed in three independent subgroups viz. (i) Village (ii) Lands, and (iii) Cattle-post in each agricultural district.

2.4 Sample Size

The sample size for the 2007 and 2008 annual agricultural surveys was decided on the basis of resources available (human capacity) as well as experiences and information obtained from the 2004 Agricultural Census. This included;

- The number of agricultural holders from the 2004 Agricultural sampling Frame
- Number of agricultural holders enumerated and their percentage
- Number of enumerators engaged during the 2004 Agricultural Census
- Duration of the census as well as average number of agricultural holders covered by one enumerator
- The available human resources

[2] *Implicit Stratification: PSUs are arranged with respect to one or more variable, which are highly correlated with the variable of interest. Implicit stratification guarantees that the sample of PSUs will be spread across the categories of the stratification variables.*

On the basis of the above information, the enumeration area sample size was estimated at 256 but was later set at 255 after it was realized that one of these sampled EAs has been turned into a Tribal Grazing Land Plot (TGLP farm). This sample yielded an estimated number of 3,450 agricultural holders.

2.5 *Allocation of Sample (EAs) To Strata*

The proportional allocation of sample to strata is normally done on the basis of the rural ecological zones namely village; Lands; and Cattle-post. Of the 256 enumeration areas selected for the Annual Agricultural Surveys, 119 were allocated to village stratum while 83 and 54 were allocated to lands and cattle posts strata respectively. The cattle post strata reduced to 53 when the other was turned into TGLP farm.

2.6 *Sample Design for Traditional Sector*

The stratified two-stage probability sample design was used for the selection of subsistence agricultural holdings sample.

The **first stage** involved the selection of enumeration areas as Primary Sampling Units (PSUs) or Enumeration Areas, selected with probability proportional to measure of size (PPS); the measure of size being the total number of agricultural holdings enumerated during the 2001 Population and Housing Census.

The **second stage** involved the sampling of Secondary Sampling Units (SSUs) and this was the actual number of subsistence farmers who were listed and identified within each selected enumeration area. These were systematically selected from a fresh list of identified subsistence farmers during listing of enumeration areas.

To identify agricultural and non-agriculture holdings, a complete listing of dwelling units was carried out in the listing form (known as Form I) in all the selected enumeration areas. To qualify as an agricultural holding, a household had to have at least one of the following or combinations of the following, cattle, goats, sheep, donkeys/mules, horses, a piece of land whether fallow or planted. This constituted a frame of agricultural holders (second stage sampling frame).

All agricultural holders with 100 cattle or more in any selected enumeration area were automatically selected with a "sure probability", indicating a one stage sampling design and hence were excluded from this newly constructed frame. Thus the frame consisted of agricultural holders with at least one of the following or a combination of the following, cattle (less than 100), goats, sheep, donkeys, a piece of land whether fallow or planted in each selected enumeration area. The supervisor selected a pre determined sample of 12 agricultural holders for each selected enumeration area. The principle of "Take-All" was applied whenever the constructed frame had 12 agricultural holders or less.

2.7 *Sampling Weights*

One of the by products of the increased availability of computer programs for processing survey data has been the practice of assigning a weight to each sample case when non-epsem[3] designs are used. The sampling weights were calculated for the sampling design used for these Agriculture Surveys.

Being a multistage design, it follows naturally that the sample selected at each stage represents (or is assumed to) the respective population. The fundamental assumption was that units selected at each stage were similar to those not selected, in respect of characteristics of interest.

[3] *epsem: Equal probability of selection method*

It is important to note that the first stage sampling weights for 2007 and 2008 Annual Agricultural Surveys also utilized the information on the first stage sampling weights of 2004 Agricultural Census **(**as EAs for 2007 and 2008 Annual Agricultural Surveys were sub-sampled from EAs selected for the 2004 Agricultural Census**)**. As the commercial sector is 100 percent coverage, there is no sampling design applied on its estimates.

The weights of the sample are equal to the inverse of the probability of selection. Therefore the sampling probabilities at first stage of selection of EAs including probabilities of selecting the holders were used to calculate the weights.

There are three components to the weighting:

(i) From EA to Stratum Level

First stage weights account for the varying probability of EA selection. That is they are proportional to the inverse of the measure of size.

First stage weight for i-th EA in h-th stratum is

$$W_{1hi} = \frac{\sum_{i=1}^{N_h} M_{hi}}{n_h M_{hi}} \times \frac{\sum_{i=1}^{N_{1h}} M_{1hi}}{n_{1h} M_{1hi}}$$

Where,

W_{1hi} = First stage weight for i-th EA in h-th stratum.

n_h = The number of Enumeration Areas selected in h^{th} stratum (2004 Agriculture Census).

M_{hi} = The size (Agricultural holders as per 2004 Agriculture Census Sampling Frame) of the i-th EA in h-th stratum

$\sum_i M_{hi}$ = The total size of the h^{th} stratum (2004 Agriculture Census Sampling Frame).

N_h = Total number of EAs in the h-th stratum.((2004 Agriculture Census Sampling Frame)

n_{1h} = The number of Enumeration Areas selected in h^{th} stratum (2007 and 2008 Annual Agriculture Surveys).

M_{1hi} = The size (holdings according to 2007 and 2008 Annual Agriculture Survey sampling Frame) of the i-th EA in h-th stratum.

$\sum_i M_{1hi}$ = The total size of the h^{th} stratum (2007 and 2008 Annual Agriculture Survey sampling Frame).

N_{1h} = Total number of EAs in the h-th stratum. (2007 and 2008 Annual Agriculture Survey sampling Frame).

(ii) From Holdings Level to EA Level

This is a simple weight obtained by dividing the total listed holdings in the EA by the number of selected holdings in that EA.

Second stage weight for i-th EA in h-th stratum is

$$W_{2hi} = \frac{M_{hi}^{L}}{m_{hi}}$$

Where,

W_{2hi} = Second stage weight for i-th EA in h-th stratum.

M_{hi}^{L} = Total number of listed agricultural holders in i-th selected EA in h-th stratum.

m_{hi} = The number of selected agricultural holders for the i-th EA in h-th stratum.

(iii) A Non-Response Adjustment

For the 2007 and 2008 annual agricultural surveys, no substitution was allowed for non-response and questionnaires had to be returned for all holdings whether responded or not as long as the holding is in the sample.

The non-response rate was made at the EA level. The adjustment was equal to the presumed agricultural holders (responded + non responded) divided by the presumed valid response (responded holders). In effect non-respondents were given the characteristics of average valid respondents in the EA.

The non-response adjustment for the i-th EA in h-th stratum

$$R_{hi} = 1 + \frac{m_{(nr)hi}}{m_{(r)hi}}$$

Where;

$m_{(nr)hi}$ = the number of agricultural holders not responded in i-th selected EA of h-th stratum.;

$m_{(r)hi}$ = the number of agricultural holders responded in i-th selected EA of h-th stratum.

Thus, the **final weight** for the i-th EA in h-th stratum are

(a) Agricultural Holders with at least 100 cattle

$$W_{100hi} = W_{1hi} \times R_{hi}$$

(b) Agricultural Holders with less than 100 cattle

$$W_{hi} = W_{1hi.} \times W_{2hi} \times R_{hi}$$

APPENDIX III: BASIC CONCEPTS AND DEFINITIONS

Standard concepts and definitions are used in any research set up to maintain consistent measurement of variables of interest and hence the following;

Surveys Year

This is the calendar year starting from January to September. At times, the fieldwork goes beyond the stipulated period but the questions asked are confined to the survey under consideration.

Traditional Sector

Traditional sector entails agricultural operations on a communal land mainly for subsistence purposes.

Commercial Sector

Commercial sector involves agricultural operations either on a freehold, leasehold or Tribal Grazing Land Policy (TGLP) farms or ranches. These operations are solely for commercial purposes.

Agricultural Holding/Farm

An "Economic Unit" of an agricultural production under single management such as total land area (fallow land and crop land) and livestock by type (cattle, goats, sheep, donkeys, mules, pigs, etc) owned, managed, rented or operated by the holder during the census year.

Agricultural Holder

An agricultural holder is a person who makes the day-to-day decisions for the agricultural holding. The holder has the responsibility and accountability for the holding and may delegate some responsibilities related to day-to-day work to other people. The holder may be resident in the farm (in case of ranches) or on a piece of land in communal areas where ploughing or animal husbandry takes place (in case of pastoral/arable/subsistence farming). The holder may also be resident somewhere else but still making major decisions on the operations of the holding.

Dwelling Unit

For the purpose of the agricultural census, a dwelling unit is a 'lolwapa'. A metal plate, with a pre-printed dwelling number is affixed on one door in the lolwapa for identification purposes.

Household

A household is any unit, family or group of people having the same cooking arrangements and/or "living under the same roof" in the same dwelling unit and eating together from the same pot and/or making common provision for food or other living arrangements.

Respondent

A respondent is any person who is at least twelve (12) years, and answers the questions during the survey.

Enumeration Area

A definable and demarcated land area marked on the map for identification purposes.

Crop land

Land of which its sole purpose is ploughing or planting crops, whether planted or fallow during the current agricultural season.

Fallow Land

Land not ploughed during the survey season but was ploughed during the past year(s) is regarded as fallow land. For a piece of land to be regarded as fallow it has to stay at most five years without being ploughed. However, this differs from one region to the other.

Field

A field is a piece of land under one use. It could be either under one crop, crop mixture or lying fallow.

Planted Land

Land area that is planted during the current agricultural season is regarded as planted land.

Crop Mixture

This is when more than one crop is inter-planted in one field such as sorghum, maize and pulses.

Pure Stand

This is when one crop is planted in one field. For example, when maize is planted alone in one field is regarded as a pure stand.

Planting Season

This is the period from October of any year to February of the following year.

Harvesting Season

This is usually from May to August of any given year.

Cattle Holder

An agricultural holder with at least 100 cattle is regarded as a cattle holder. This holder is not exclusive to such cattle holding but may hold other holdings such as small stock and crop land.

Other Agricultural Holder

Any agricultural holder who has at most 99 cattle in addition to other holdings such as small stock, crop land and other livestock is regarded as any other agricultural holder.

Birth Rate

This refers to the ratio of total number of births during the survey year to total number of livestock (cows, goats and sheep) during the same survey year or agricultural season.

Death Rate

This refers to ratio of total number of deaths during the survey year to total number of livestock by type (cattle, goats and sheep) during the same survey year or agricultural season.

Off take = Sales – Purchase + Home Slaughter.

Off take Rate

This refers to ratio of off take to total number of livestock by type (cattle or goats and sheep) during the survey year or agricultural season.
