The replication data consists of two Stata datasets ("BMW Dataverse dataset" and "fria.amended3") and a Stata dofile ("Dofile Institutionalizing the Autocratic Penalty Away"). Start by saving the two datasets locally and then open the dofile. Make sure that the two "merge" functions at the beginning of the script calls the two datasets (you have to specific their locations on your computer). Then you can run the dofile which should reproduce all the figures and tables from the article.
