...AND THE VOTING CONTINUED...
YAAAAA!!
THIS IS AN EXIT POLL! HOW OLD ARE YA? ARE YA RICH OR POOR? SHORT OR TALL? SMART OR DUMB? FRESH OR STINKY? YOU EAT QUICHE? WITH OLIVES? PITTED OR NON-PITTED? WHO'D YA VOTE FOR BACK THERE?
CBS
THAT'S THE MEN'S ROOM.
RIGHT! HAND SOAP SOLID OR LIQUID?

INTRODUCTION

This report is a description of the BYU Exit Poll that was taken during the Nov. 4, 1986 election. The exit poll is used to survey voters as they exit the polling places in order to determine how they voted in order to project a winner. It also serves as a medium to gain information about the population who voted and the viewpoints and ideas of the voting people about political issues. This paper ~~will proceed to~~ describe the design and implementation of the exit poll, ~~dealing only with the responsibility of the 534 class~~ (~~that being~~ the design of the sampling method that would get estimators with the smallest possible bias to be able to call a race as soon as feasible).

The outline of the report is as follows. The first section will deal with the methodology of the design ~~of the survey~~. (Then a section dealing with a more detailed explanation of the equations and how they were used, and finally the conclusions and recommendations.) Also, appendices will be given containing pertinent data files and results.

METHODOLOGY

The sampling design is described as a ~~2-stage~~ stratified, 3-stage cluster ~~systemized random~~ sample.

Step 1: Stratify the counties according to Congressional District.

Step 2: Choose which counties must be included in the sample(i.e. certainty and non-certainty counties).

What is a certainty county?

Step 3: Stratify the non-certainty counties according to population size. We tried to put at least 4 in each strata. The certainty counties are each considered a strata.

Incomplete sentence

Step 4: (PPS sampling of two counties from each of the non-certainty county strata.) Consider each county a cluster of precincts.

Step 5: Systematic and PPS sampling of precincts within each selected county (randomly select a starting precinct and then go systematically to get the rest of the precincts needed in the sample).

Step 6: Systematic random sample of people in the voting precinct.

Congressional District #1	Congressional District #2	Congressional District #3

Tooele)		

) or (= Certainty counties
* = the counties chosen from the non-certainty strata

Appendix A and B have all the data used in choosing the counties and each of the precincts chosen within each of the counties. We also had to consider the fact that the counties sometimes combine two or more voting precincts into one voting place. So instead of considering the number of voter precincts we had to consider the number of voting places when we selected the random representatives from the counties. For example, Rich county has five precincts but 2 of them are in the same voting place so we had to consider Rich county as having 4 voting places when we did the random sample of precincts.

In order to determine how many people would be sampled from each precinct we went by a statewide sampling fraction. We were told that from the whole state we would sample 2700 people plus 10% for sampling error (2970 total). This number divided by the total number of people expected to vote gave the state wide sampling fraction. First, however, we had to determine the expected voter turnout for the 86' election.

We had access to the 78' and 82' Total Registered for the Election and Total Turnout for the Election by county (referred to below as 78TRE, 82TRE, 78TTE, and 82TTE).

$$\frac{\frac{78TTE}{78TRE} + \frac{82TTE}{82TRE}}{2} = \text{average turnout (AVT)}$$

82TRE/78TRE = increase ratio (IR) assuming a steady rate of increase, this multiplied by the 82TRE will give the expected voters for the 86 election.

Taking the expected voters in the 86' election and multiplying it by the AVT gives the Expected voter turnout for 86'. The sum of the expected voters gave the statewide estimate of voter turnout for 1986. This was figured using county totals. See appendix B for the results of these computations. How good were your estimates?

A more specific number for predicted turnout by voting place was done using the following ideas.) Bad sentence.

In order to form the estimates of total voter turnout (by voting place) for the November 1986 election, we relied upon information from the 1982 general election and 1986 primary election. The data from 1984 was not considered useful since the 1984 election was a presidential election and the 1986 is a non-presidential election.

The following were ~~thought~~ assumed to be approximately equal:

$$(RE86/RP86) = (RE82/RP82)$$

and

$$(TE86/RE86) = (TE82/RE82)$$

Where:

RE86 = # of people registered for the general election in 1986.

RP86 = # of people registered for the primary election in 1986.

TE86 = # of people voting in the general election in 1986.

RE82 = # of people registered for the general election in 1982.

RP82 = # of people registered for the primary election in 1982.

TE82 = # of people voting in the general election in 1982.

From these ratios we formed the following estimation equations:

$$RE86 = RP86 \times (RE82/RP82)$$

$$TE86 = RE86 \times (TE82/RE82)$$

Substituting the first equation into the second equation eliminates RE86 for which we have no data (We have no data because people can still register for the election). After making this substitution the equation becomes:

$$TE86 = RP86 \times (RE82/RP82) \times (TE82/RE82)$$

Since we did not have RP82 available by voting place we approximated the ratio RE82/RP82 with the state wide ratio which is 748,730/703,546 = 1.064223235. This ratio gives the increase in registered voters from the primary to the general election in 1982. Using this approximation the equation becomes:

$$TE86 = 1.064 \times RP86 \times (TE82/RE82)$$

For all of the voting places we had RP86. For most of the voting places we had TE82 and RE82. For those that were missing TE82 and RE82 we used the TE82 and RE82 from the county to estimate (TE82/RE82).

See appendix A for the actual estimates by voting place for the counties that were sampled.

ESTIMATORS AND VARIANCES

The following are formulas for the estimates and variances.

I. The formulas of this section are the estimators and variances of the certainty counties and the Salt Lake district.

A. The formula of the proportion:

$$\hat{p} = \sum x_{ij}/pn$$

B. The variance formula is:

$$V(\hat{p}_i) = [1/p(p-1)] \sum(\bar{x}_i - \sum \bar{x}_i/p)^2$$

The definitions of the subscripts referred to in the formulas are:

i = polling place

j = voter polled

x = 1,0 according to who was voted for

n = # of voters

p = # of precincts

x_i = ith precinct mean

II. These are formulas for the non-certainty strata.

A. The proportion formula:

$$\hat{p}_i = \sum x_{ijkl}/cp_{ij}n_{ijk} \quad \text{where: } c=2$$

B. The variance formula:

$$V(\hat{p}_i) = (\bar{p}_1 - \bar{p}_2)^2/4$$

where: i = the stratum index

j = the county index

k = the precinct index

l = the voter index

c = the # of counties

p and n as defined previously

what is $\bar{p}_1 + \bar{p}_2$

III. Specifics

A. The formula to figure the estimate and variance of the state wide race:

$$\hat{p} = \sum \hat{p}_i / (\#\text{ of } \hat{p})$$

$$V(\hat{p}) = (\bar{p}_s - \bar{p})^2/(n-1)$$

where: p_s= the proportion for strata

B. The following are formulas used in figuring estimates and variances across the congressional districts.

1. The estimate of proportion for districts 1 and 3 is the mean of the proportions of strata in each distinct district.
2. To estimate the variance would be to take the proportions of each strata and calculate a variance of those proportions.

RESULTS

Below are listed the results of the exit poll in actual figures and the estimates which we produced. Four estimates are listed according to the time intervals when these estimates were figured. In comparing our estimates with the actual results we found that from our final estimate we came within 2 or 3 percentage points of the real value. On the next page is the table listing these values.

RACE	ACTUAL VOTED FOR	ACTUAL TOTAL VOTES	%	OUR ESTIMATED % FOR RUN # 1	2	3	FINAL

CONCLUSION

The conclusion is that the poll was a success in that we arrived at estimates very close to the actual values, and our variances (though not presented in this paper) were fairly small. There were a few problems enccuntered. One with the refusal rate on completing the surveys and the other was over estimated totals of voter turnout, though from our results it didn't seem to hurt our estimates too much. Below is a list of recommendations for consideration in doing the exit poll.

was required to be a part of the paper.

Is the refusal rate the only problem that was encountered?

RECOMMENDATIONS

These are some recommendations we feel should be considered in the next execution of an exit poll. No real concrete evidence has been shown as to why the refusal rate appeared to be higher then expected. Listed here are some reasons we feel the rate was so high and also our suggestions as to how this rate could be lowered.

Was the refusal rate high?

Reasons:

1) The pollsters may not have been present at the polls during the hours required.

2) The pollsters were not adequately informed as to their job.

3) The survey may be too long.

4) The voters are tired of being polled.

Recommendations:

1) A review should be done to see if the actual survey sheets can be condensed into a shorter survey with less crowded print on the page.

2) Consider the possibility in the color of the survey form.

3) Training sessions should be used to assure that the pollsters are well informed as to the importance of their work, what they need to do, the appearance they should have in their dress, and their approach on the voter.

Were they well informed?

4) Select specific hours by randomization and certainty so that the survey is made only part of the day.

APPENDIX A
