Pre-Analysis Plan Addendum

Study Information

8 Feb 2023

1. Title: **Addendum: Inequality, Ideology, and Redistribution**

2. PIs: Michael M. Bechtel, Taishi Muraoka, Guillermo Rosas

This document updates the primary pre-analysis plan (PAP) "Inequality, Ideology, and Redistribution". In addition to the analyses specified in the primary PAP, we have revised the non-US portion of the survey and implemented the following modifications.

- The tax plan conjoint includes a party endorser attribute. This attribute samples from the existing parties in a given country and randomly assigns an endorsing party. We use this design to test the partisan cue/ideological alignment argument (Bansak et al. 2021 APSR) which predicts that tax proposals will elicit higher support if they are endorsed by a party that a respondent identifies with or, alternatively, that policy support for a proposal increases in the ideological proximity between a respondent and the endorsing party.
- To generate predicted levels of support and compute the policy support frontier analysis, the tax plan conjoint includes a rating component. This relies on the following question: "*If you could vote on each of these tax plans in a referendum, how likely is it that you would vote in favor or against each of the options? Please give your answer on the scale of 1 to 10, where 1 means "Definitely against" and 10 means "Definitely in favor".*"
