Instructions for replicating the analysis presented in
Corrêa, Diego S. and José Cheibub. 2016. The Anti-Incumbent Effects of Conditional Cash Transfer Programs. *Latin American Politics and Society*, 58(1), 49-71.

1. Extract the raw data from the LAPOP website: www.vanderbilt.edu/lapop. In the article we used data from 21 surveys carried out in 2010. The countries to which these surveys refer can be found in the article.

2. Open the dataset extracted from the LAPOP website on Stata.

3. Open the "Replication.do" file on Stata.

4. Browse the "Replication.do" file for the commands corresponding to the country whose dataset you opened on Stata.

5. Apply the commands under "### Dependent and Independent Variables" to create the variables we used in our analysis.

6. Apply the other commands to replicate the analyses we report in the paper. In the .do file you will find references to the table and appendix where the results for each set of commands are reported.
