Notes on replication data

I have provided the do-files and data underlying the article titled, "*Unwelcome neighbors: Poverty and anti-immigrant sentiment in Morocco.*" The analysis was conducted using STATA 17. Five data files and two do-files have been provided, each of which is discussed below.

Main data and regression codes

- The file **pooled_data** contains data appended across Rounds 7 through 10 of the Afrobarometer surveys. All variables required to estimate the regression models have already been created and labelled accordingly.
- The do-file **regression_codes** contains the codes required to execute the regression models using the pooled dataset—i.e., **pooled_data**

Raw data and do-files

- The files **raw_R7** through raw_R10 contain the raw data from Rounds 7, 8, 9, and 10 respectively of the Afrobarometer survey used to develop the pooled data discussed above.
- The do-file **codes_sort_raw_data** contains the codes used to sort the raw from each survey round to create the variables of interest. Separate sets of codes have been provided for each round. To derive the pooled data, the created variables (after running the codes) will have to be appended across the four rounds.

***Note:** the raw Afrobarometer data and the survey questionnaire are also publicly available on Afrobarometer's website: https://www.afrobarometer.org/
