# READ-ME DOCUMENT FOR REPLICATING THE ANALYSES FROM THE MANUSCRIPT "Exploring attentional bias towards alcohol content: Insights from eye-movement activity"

Dear Researcher:

The documents enclosed and attached in the current dataverse link *(https://doi.org/10.7910/DVN/XOOXPO)* correspond to the underlying data supporting and endorsing the results and subsequent conclusions of the manuscript entitled "Exploring attentional bias towards alcohol content: Insights from eye-movement activity".

We therefore attach two different subsets, corresponding to Experiments 2 & 3 of the current manuscript, respectively. Also, a Codebook is included, with the aim of easing the comprehension of the different variables encompassed in both databases. Furthermore, a Syntax file is also enclosed for a better replication of the analyses performed.

Please find enclosed the steps **to replicate the current analyses**:

1. Open both databases and the document "Codebook", to easily understand the correspondence of each variable included;
2. Open the Syntax document and apply to each one of the databases to check and verify the results obtained.

In the eventuality that the researcher would like **to proceed similarly to our research with his/her own data**, please follow the following steps:

1. Open both databases and the document "Codebook", to easily understand the correspondence of each variable included;
2. Close both databases, and open your own database;
3. Open the Syntax document, and adapt the Syntax here provided to the names of your own variables;
4. Apply the Syntax to your database;
5. Proceed to obtain your own results stemming from the data from your research.

Thank you for relying and trusting our research process.

Godspeed,

*The Authors*
