Replication of
When Do Citizens Consider Political Parties Legitimate?

Ann-Kristin Kölln, University of Gothenburg

Data

The analyses rely on original survey datasets collected by the projects 'Identifying Political Parties' Institutional Legitimacy and its Sources' (Aarhus University Research Foundation, AUFF-E2017-7-13) and 'Political Parties' Institutional Legitimacy and its Sources' (Riksbankens Jubileumsfond, RIK18-1267:2).

The cross-sectional survey covers seven West European countries (Denmark, France, The Netherlands, Germany, United Kingdom, Portugal, Spain) with 1000 respondents each. The dataset PartyLeg_crossec.csv is based on party-respondent dyads, i.e., long format (N = 469,000), and contains all the variables necessary to replicate the analyses.

The survey experiment was conducted in Denmark with 4423 respondents. The dataset PartyLeg_exp.csv contains all the variables necessary to replicate the analyses.

The pilot study for the experiment was conducted in Denmark with 1392 respondents. The dataset PartyLeg_pilot.csv contains all the variables necessary to replicate the analyses.

Code

The file PartyLeg_Study1.R contains code for replicating all tables and figures connected to the cross-sectional study in the main body of the text and the supplementary information using R software.

The file PartyLeg_Study2.R contains code for replicating all tables and figures connected to the experimental study in the main body of the text and the supplementary information using R software.

The file PartyLeg_exppilot.R contains code for replicating all tables and figures connected to the pilot study in the supplementary information using R software.
