Readme – Income and Inequality – Experiment

The data file is “sasinequalityexperiment.sas7bdat.” There is also an excel version of the data file.

The variables labels and questions can be found in the file "Income and Inequality - Experiment - Questionnaire.pdf"

The SAS code to run the analyses to reproduce the results that are reported in the paper is "SAS syntax - Income and Inequality - Measuring Morality survey study.sas"

Note that this survey was constructed so that half of the participants would be directed to a separate unrelated study that examined the validity of measures of achievement values. The questionnaire shows these unrelated measures, and the data set has (empty) columns for these measures. None of the participants who did the study of inequality, income, and generosity completed the achievement values items, and vice versa.

Also, note that all data that, at any point in time, could be connected to any identifying information (e.g., Qualtrics response IDs, Amazon Mechanical Turk IDs) were removed from the data file before it was moved to the dropbox folder.
