ICPSR 3524 (Reformatted Data): Census of Population and Housing [United States], 1970: Fifth-Count Tallies: Sample Data for School Districts

These fifth-count summary statistics by school districts (1974 to 1975 boundaries[1]) were created from sample (20-percent, 15-percent, and 5-percent) portions of the 1970 Census of Population and Housing. The geographical hierarchy of the data file is states followed by an ascending sequence of 5-digit school district codes within each state. School district data are tallies based on enumeration districts and block groups. Contrary to the information in the original codebook, there are no county component records where school districts cross county lines and there are no 1970 FIPS county codes. Users should always refer to the original codebook for more information about school district tallies (tables). Most have footnotes.

The original data file contained 4 physical records for each logical record. The original file has been reformatted by the SSDC staff so that there is 1 physical record for each logical record. Ninety-six characters of padding (spaces) were removed from the end of each record. Column locations for the geographic variables and summary statistic tallies (tables) in the reformatted data file are listed below.

REFORMATTED DATA FILE
File Format: Rectangular ASCII
Logical Record Length: 7585
Number of Records: 11738
Record Delimiter: Line Feed
Records Per Case: 1

Data Items: All geographic identification, population and housing tallies (tables) from the original codebook. Data items ending in a ":" (colon) do not have a corresponding data table. Coding values for states, districts and grade spans are located in the Geographic Records Variables file.

Start: For each record in the reformatted data file, the starting column of the geographic variable or data tally (table).

End: For each record in the reformatted data file, the ending column of the geographic variable or data tally (table).

Total: The total number of columns for each geographic variable or data tally (table).

Variable Label: For each geographic variable or data tally, a corresponding variable label (usually a table) that can be used to subset one or more data items from the SSDC data extraction Web page. Users can use the PDF bookmarks or the Edit-Find command to search for data item keyword(s) and note the corresponding variable labels.

[1]A geographic reference file for 1973-1975 school districts is available from ICPSR. SCHOOL DISTRICT GEOGRAPHIC REFERENCE FILE, 1973-1974 [ICPSR Computer file 3516].

More information about the construction of the reformatted data file and codebook can be located in the DATA FILE NOTES section.

Reformatted Data File Notes

The original Census Bureau 1970 school district data file is difficult to use because:

1. There are four physical records for each logical record.
2. There is no variable to identify the physical records.
3. Variable column locations are difficult to determine.
4. There are no component county records where school districts cross county lines and no 1970 FIPS county codes.

The SSDC staff examined the original data with a file viewer and confirmed the file layout was correct according to the information in the original codebook. We determined that the file could be easily reformatted. UNIX "tr" was used to remove the record delimiter (line feed) and a local PERL program, "linelen", was used to create a reformatted file with one physical record for each logical record and strip the 96 characters of padding (spaces) at the end of each record. Data and record integrity was confirmed with another local PERL program, "check-it-out". The resulting reformatted data file has the following characteristics:

REFORMATTED DATA FILE
File Format: Rectangular ASCII
Logical Record Length: 7585
Number of Records: 11738
Record Delimiter: Line Feed
Records Per Case: 1

In the original codebook, the column position identification is specified by a block (1920 character physical record), a subblock (a logical division of the block into sets of 120 characters each), and an initial character within the subblock. Moreover, only the starting position of the first variable is identified for all of the 8 or 16 character variables listed on each page of the original documentation.

The SSDC staff created a reformatted codebook that documents the starting, ending, and total column length of each variable in the reformatted data file. We created a spreadsheet with four columns or fields (variables, start column, end column, total columns). The variables column was created by copying and pasting the variables from the original codebook. The start, end, and total columns for each 8 or 16 character variable was calculated using a formula based on the column position identification in the original codebook.

1) First variable starting column: ((block-1) * 1920) + ((subblock -1)*120) + (initial character) = start.
2) First variable ending column: (start) + (7 or 15) = end.
3) First variable total columns: (start)-(end) + 1.

Subsequent variables were calculated by using the value from the ending column of the first variable. The reformatted variable column locations were verified with a file viewer and by extracting random variables from the original and reformatted data files and comparing the values of the results.

The SSDC staff added a variable label column to the spreadsheet so that each variable could be easily identified. The spreadsheet was converted to PDF format and bookmarks for each statistical table were added by copying and pasting table names within the PDF text. This PDF file is the Reformatted Codebook.

Fields from the spreadsheet (variable label, start column, total columns) were output to ASCII CSV format. The CSV file was imported into DBMS/COPY and additional fields and values were added to conform to the layout specified in the SSDC Codebook for OSIRIS/ASCII Data Dictionaries. The output file was used to build a "drop-down" list of variable labels that our users can use to subset table data from the reformatted data file.

The original codebook specifies county component records for school districts that cross county lines. "*In these cases, the school district total record precedes its county component records, which are sorted by 1970 FIPS county code*." When we were examining the original and reformatted data files, we noticed that there were no 1970 FIPS county codes in any of the data file records (columns 4-6). We were not sure if (1) county component records lacked corresponding FIPS county codes, (2) there were no school districts that crossed county lines, or (3) county component records were not included in the original data file.

We used the School District Geographic Reference File, 1973-1974 (ICPSR 3516) to provide an answer. California school district names and their corresponding school district codes and county codes were extracted from this data file. Then we created a unique list of school districts by county and district codes. From this list we concluded that many districts in California cross county lines. We checked the California school districts in the original data file to determine if county component records followed district records that crossed county lines. The original codebook states that "*For county component summary records, the county code field will contain the 1970 FIPS county code and the name field will contain the county name*". In the original data file, one school district follows another in sequential order by a five-digit school district code. There are no California county component records or 1970 FIPS county codes in the original data file. Finally, we randomly checked other states and conclude that there are no county component records in the original data file.
